The NSW Government needs to look into solar feed in tariffs. They have been falling for years. 10 years ago I was receiving a feed in tariff of 60 cents and now the highest feed in tariff is about 10 cents and retailers are putting limits on the total amount you can be paid per day for exporting energy. I have upgraded my solar panels and purchased a 13.5 kW battery and the only way to get a higher feed in tariff is to join a virtual power plant. Why are higher feed in tariffs not available to everyone, especially if they have a battery and can export at the same time? I bought a battery to protect my house from blackouts and I shouldn't have to give control to a retailer to get a higher feed in tariff. My investment in solar and a battery is becoming worth less and people are being pushed toward joining a VPP when they don't want or need to.
