Submission: IPART appears to have not considered the contributions of rooftop solar in reducing the need to build alternative generating capacity (and thus a cost foregone) during daytime business hours and thus the community savings that have resulted. Retailers have a plethora of pricing plans which are deceptive in that they have higher supply charges per kwh for solar consumption than for no solar customers. This discrepancy often results in FITs being overstated in terms of customers savings. In considering the pricing of FIT, Ipart is using a decline in consumption largely due to Covid which will not be a consideration for 2022 to 2024 as vaccines impact on communities and thus should not be viewed as a long term trend. Solar consumers are being exploited by retailers and Ipart seems to be more interested in increasing the income of generators and retailers than looking after consumers.
