Your submission for this review:

1. Considering the publicity about growing population over many years and the need for infrastructure expenditure to support the provision of housing to accommodate this population growth, it is astounding that Sydney Water has apparently done nothing to improve infrastructure and instead of proposing a major capital works program based on projected upcoming development it is proposing to truck sewerage to existing sites . There doesnt appear to be any forward planning, even now. 2. The proposed expenditure over the short term forward years appears to only address this trucking to existing sites. What sort of a plan is that. 3. If that is all they intend to do that seems like we will be hitting a major roadblock of insufficient infrastructure very quickly, with even less capacity to do anything about it. 4. As all of the stop gap expenditure is simply to allow developers of new projects to truck waste to existing facilities, why should existing customers pay anything? 5. This all leads to an indication of unbelievable incompetence in relation to forward planning of infrastructure construction in a growing population environment.
