IPART should investigate embedded networks, these are a rort and something needs to be done. I have recently moved into an apartment which is supplied through an embedded network and th electricity prices I am being charged now are so much higher compared to when I was in a home. I have tried to move retailers but eahc time I've been turned down as the retailer essentially says there are issues with the infrastructure and metering that prevents me from moving. I'm essentially locked into an embedded network that can to charge me as much as they want. The only saving grace is that I'm using less electricity as the apartment is warmer than my old house, but this shouldn't be a reason why they are allowed to charge so much more.
