Your submission for this review:

Energy retailing has been built on grand, centralised provision, with huge costly transit power lines between energy generators and consumers. That is a redundant model. Power can be very efficiently generated onsite or near site. The eroi costs of transit is too high and inefficient when compared to the distributed network that is possible. However, the existing model has concentrated money and power in existing large scale provision. The government has to be able to look past that, and prepare for future efficient and distributed networks. The transition demands better tarrifs and lower costs for onsite power generation. Net zero carbon emmissions need to be at the forefront of decision making.
