I fail to see how you can justify cost increases in the order of 20+ % a year on water charges. This relates to a in turn reduction of my income which has no productivity advantages for my business. Most of the services are for the benefit of river pumpers , as a Mil user I'm being double dipped. There is no way known that I will receive increases in my produce prices of the magnitude that your saying water prices will increase. I can understand user pays but upping Govt costs on water I don't necessarily receive is just a form of revenue raising which every one should share. Cost of living is going up , and because of these price increases not only do i cop this but my income actually decreases. How about waterNSW reduce their members wages to make up the difference?
