Your submission for this review:

Regarding our electricity network operators, the biggest problem they are having is their original transformers in the present grid system is not coping with the extra load of electricity current with the advent of many numerous Solar installations on properties, to such an extent that these transformers are breaking down, our government's need to supply these companies with the funds to upgrade all these transformers to cope, and this is why many more blackouts will occur as this summer approaches, you could say this government has not given the back up to support the new loads on the grid, besides this ,those wonderful electricity network operators are doing a wonerful job to cope to keep our grid supply. A wake up call is better to our Government. Cheers Terry Hudson [REDACTED]
