

INDEPENDENT PRICING AND REGULATORY TRIBUNAL

**RETAIL ELECTRICITY MID-TERM REVIEW
PUBLIC FORUM**

**Held at Meeting Room 1, Level 2
44 Market Street, Sydney NSW 2000**

On Friday, 3 May 2002, at 9.35am

1 MR COX: Ladies and gentlemen, we will now start the
2 forum. I am Jim Cox, I am a member of the tribunal,
3 and my colleagues Mr Tom Parry and Ms Cifuentes will
4 join us a little later during discussion.
5
6 Thank you for coming along. The purpose of the
7 forum is that it is part of our public participation
8 process, so it is to give you an opportunity to
9 raise issues which are of concern to you and we will
10 also share some of our analysis with you. Then we
11 will have some discussion of issues.
12
13 This is a public workshop and we would like you
14 to sign the attendance sheet at the back of the room
15 if you have not already done that.
16
17 The way we will organise it is that first of
18 all Michael Seery will speak a little bit about the
19 scope of the review. Then we will have three
20 sessions. The first session will look at the issues
21 of target tariffs and it will discuss questions that
22 we think are appropriate. After that we will look
23 at issues involved in achieving the target tariffs,
24 how quickly prices can be increased to necessarily
25 do that, and also we will look at questions
26 concerning side constraints. The final session will
27 deal with a number of specific issues about
28 regulated retail tariffs.
29
30 That is the plan. The way we will do it is get
31 members of the secretariat to introduce each topic,
32 then we will go round the table, giving people
33 sitting at the table the opportunity to have their
34 say. I suggest the way we do that is to limit each
35 speaker to about five minutes, not have
36 interruptions during the time that each person is
37 speaking, and have only have one member from each
38 organisation speak per topic. Once everyone around
39 the table has spoken, I will give people a chance to
40 respond to comments made, then give people sitting
41 in the back of the room a chance to make some
42 comments or make suggestions if there is time to do
43 that.
44
45 We are transcribing the proceedings to help us
46 finalise our work on this topic, so if people could
47 introduce themselves before they speak, particularly
48 if you are at the back of the room and you are
49 speaking for the first time.
50
51 That is by way of rules. What I would like to
52 do now is to go around the table and give everyone
53 at the table the chance to introduce themselves; and
54 I will start by introducing myself, I am Jim Cox, a
55 member of the Tribunal.
56
57 MR SEERY: Michael Seery, Program Manager, Electricity
58 Pricing with the tribunal.

1
2 MR BEARD: James Beard, the Centre for International
3 Economics, working with the tribunal on this review.
4
5 MS HARMAN: Christine Harman, TXU.
6
7 MR EGAN: Gerry Egan, also with TXU.
8
9 MR NASH: Andrew Nash, Integral Energy.
10
11 MR NEVILLE: David Neville, Integral Energy.
12
13 MS WALDMAN: Karen Waklman, Integral Energy.
14
15 MR WELFARE: Luke Welfare, Macquarie Generation.
16
17 MR KELLY: Sean Kelly, AGL Retail.
18
19 MS BANICEVIC: Nathalie Banicevic, Country Energy.
20
21 MS TERRI BENSON: Terri Benson, Country Energy.
22
23 MS TRISH BENSON: Trish Benson, PIAC.
24
25 MR JIM WELLSMORE: PIAC.
26
27 MR STEPHEN BORAS: Stephen Boras, Eraring Energy.
28
29 MR GRAEME LEES: Graeme Less, EnergyAustralia.
30
31 MR COX: Thank you very much. We will now have Michael
32 speak a bit about the review.
33
34 MR SEERY: I will not be long in this session. I just
35 want to talk about, as Jim says, the review and how
36 we propose to finish the review.
37
38 As you will recall, the Minister requested the
39 tribunal to undertake a review of its determination
40 put in place in 2000 for regulated retail tariffs.
41 In conducting the review it is necessary to remember
42 that we are talking about regulated retail tariffs
43 and these are the tariffs that apply to small retail
44 customers who elect to stay on a standard form
45 customer supply contract or who move away from such
46 tariff and then come back to a standard form of
47 customer supply contract.
48
49 In its determination the tribunal limited the
50 number of regulated retail tariffs and this was
51 basically for simplicity. The tribunal's view was
52 that a regulated retail tariff should be a no frills
53 tariff, that there should be as few options as
54 possible and no special features to those tariffs.
55 The question then is what should be in a regulated
56 retail tariff. It really relates to the cost to
57 supply but it needs to reflect efficiency costs and
58 there needs to be a balance between whether those

.3/5/02 3

Transcript produced by ComputerReporters

1 tariffs are too high or too low.
2
3 If the tariffs are too high, it would
4 disadvantage those customers who cannot enter into
5 the contestable market. As noticed in the terms of
6 reference, it is basically in that respect a safety
7 net tariff. If the regulated retail tariff is set
8 too low, that would hinder competition.
9
10 The terms of reference of the tribunal, if you
11 look at the document put to us by the Minister,
12 breaks down into three main areas: has there been a
13 material change in the costs, including the retail
14 contestability cost, to justify change in the target
15 tariffs, and that will be the basis of discussion
16 session one; secondly, do the participants believe
17 the tariff target level will undermine operation of
18 the competitive retail market and what are the
19 impacts of side constraints, which will be the basis
20 of discussion session two.
21
22 Finally, the tribunal is to consider other
23 things like whether there should be new tariffs, for
24 example, green tariffs, and to look at off-peak
25 tariffs, including the merits of a shoulder tariff.
26 Those issues are the basis of our discussion in
27 discussion session three.
28
29 The timetable for the review is that we have
30 the public forum today and the tribunal anticipates
31 it will be able to release its determination towards
32 the end of June so that the retailers can make
33 notifications to the tribunal on price changes by 1
34 July for those price changes to be effective from 1
35 August this year.
36
37 MR COX: Thank you, Michael. The first session is going
38 to be on target tariffs. To introduce this topic I
39 will ask James Beard to speak. James is a
40 consultant from the Centre for International
41 Economics who is working with us to assist us in
42 this inquiry, so I will ask James to lead off.
43
44 MR BEARD: Thank you, Jim. The target tariff is built
45 up, as you know, between an NEM and an R component.
46 The NEM is a pass-through component and the R is the
47 retail margin or mark-up. I will just talk a little
48 bit about the analysis we have done in terms of
49 examining that R component and if there has been any
50 material changes since the original determination.
51
52 Just to refresh your memory, the tribunal has
53 taken an approach where it has benchmarked the
54 various cost components of the R and those cost
55 components are long-run marginal costs which reflect
56 the costs of energy purchasers, including green
57 energy, retail operating costs, retail net profit
58 margin, international market fees and transmission

1 and distribution losses.
2
3 As part of the mid-term review the tribunal is
4 required to examine the circumstances to see if
5 there have been any changes, any material changes,
6 to those factors that would mean those allowances
7 should be shifted up or down.
8
9 This morning I will focus on the analysis we
10 have done in terms of long-run marginal cost, retail
11 operating costs and net profit margin and I will
12 just briefly indicate where our analysis is heading
13 on those issues. It should not preclude you from
14 raising issues in the forum on NEM fees and
15 transmission and distribution losses, which we have
16 not progressed the analysis on that far yet.
17
18 In terms of long-run marginal cost, the current
19 allowance is based on some modelling commissioned by
20 the tribunal at the time of the original
21 determination and also other relevant studies of
22 long-run marginal cost which have indicated a fairly
23 large range of between \$36 and \$56 per megawatt
24 hour. In terms of the submissions we have received,
25 they have again highlighted the divergence in
26 long-run marginal cost estimates that are floating
27 around.
28
29 We received submissions which suggested
30 long-run marginal costs between \$32 and \$58 per
31 megawatt hour. The submissions also raised some
32 questions about the assumptions underlying the
33 original modelling in terms of the peakness of
34 demand, costs of gas, costs of coal plant and the
35 forecast load, which has also been updated.
36
37 In terms of investigating those assumptions, we
38 have taken those and tested what those variations
39 and assumptions would mean in terms of the output of
40 the original modelling framework. The one that had
41 the most significant effect on the range is the cost
42 of coal plant. In the original model it was assumed
43 at \$950 per kilowatt and we have tested \$1200 per
44 kilowatt, which is an average used by NEMMCO in some
45 of its analysis, and that shifts the range from \$36
46 to \$56 to \$39 to \$58. So it is not a significant or
47 large change but it may warrant a shifting of the
48 long-run marginal cost allowance to that order of
49 magnitude.
50
51 In terms of the green allowance, or
52 incorporating the green requirements, there have
53 been two main changes since the original
54 determination. One, the Commonwealth mandatory
55 renewable energy target scheme has now been
56 finalised and implemented. The other change has
57 been that the New South Wales benchmark licence
58 requirements have been or are in the process of

1 being tightened.
2
3 I will talk about the Commonwealth scheme.
4 Some of the modelling suggested by the New South
5 Wales Treasury in support of the New South Wales
6 benchmark licence requirements has incorporated the
7 effect of the Commonwealth scheme on the system and
8 that modelling suggests that costs of up to 38 cents
9 per megawatt hour might be a reasonable compliance
10 cost over the first couple of years of the scheme,
11 which corresponds to the two years remaining in the
12 determination.
13
14 Submissions by retailers have suggested a value
15 closer to 25 cents per megawatt hour so in terms of
16 where we are coming at, it looks like an allowance
17 of between 25 cents and 38 cents a megawatt hour
18 would appear to be sufficient to cover that cost
19 element.
20
21 In terms of the New South Wales benchmark
22 licence requirements, the licence requirements were
23 in place at the time of the original determination
24 but the proposed changes mean that the targets will
25 become binding on retailers and other users by
26 2006/7. The Government has modelled the costs of
27 that using a linear programming model and has looked
28 at the compliance costs of the benchmark scheme over
29 and above compliance with the Commonwealth scheme,
30 which forms part of the baseline, and their
31 modelling indicates that over the two years that
32 remains in the determination that compliance costs
33 of around 50 cents per megawatt hour would be
34 incurred, although these do rise over a longer time
35 frame. As the target becomes closer, it becomes
36 more difficult to meet that, so they rise to over \$1
37 a megawatt hour.
38
39 One of the key issues for the tribunal is that
40 the outcome, the final scope of the licence
41 requirements is still uncertain and some issues
42 regarding trading of interstate trade in
43 electricity, recognition of the Commonwealth scheme,
44 those are yet to be finalised.
45
46 Going back to the original determination, the
47 original determination made an allowance for green
48 electricity, for the licence requirements. It is
49 not explicit, the range or the allowance that is in
50 the modelling, but basically the range for long-run
51 marginal cost estimates was estimated on the
52 assumption that there would be sufficient
53 electricity purchases, green electricity purchases
54 that met the licence requirements, so they assumed
55 that the 5 per cent target, as it was then, was
56 actually binding, so the modelling assumed that the
57 target was binding, as it will be under the proposed
58 changes.

.3/5/02 6

Transcript produced by ComputerReporters

1
2 We have calculated what the effect of removing
3 that target would mean to the model, to the range,
4 the long-run marginal cost range, and that comes out
5 between 50 cents and \$1 a megawatt hour. The
6 implication is that the original range for long-run
7 marginal cost actually included between 50 cents and
8 \$1 per megawatt hour for the benchmark licence
9 requirements in New South Wales.
10
11 Going back to the work that has been done,
12 Treasury or the government estimated compliance
13 costs from the scheme would fall within that range
14 but the costs submitted by retailers and others
15 would fall outside the range. Submissions have also
16 included costs which are higher than that range.
17
18 The other important point that we have to think
19 about in this analysis is that the target tariff was
20 based on a long-run marginal cost estimate so it is
21 the costs of energy based on a long-run marginal
22 cost concept and we have to think a little bit about
23 how we compare that with premiums over and above
24 market prices which have been put in submissions, so
25 the two concepts are separate and they are not
26 necessarily comparable. We need to be careful how
27 we incorporate that into the target tariff.
28
29 On retail operating costs, the original
30 determination allowed costs of between \$40 and \$60
31 per customer inclusive of the \$50 FRC allowance. If
32 you take away that allowance, \$35 to 55 dollars per
33 customer. Again, that range was set based on
34 benchmarks and those benchmarks were to cover costs
35 such as billing, IT, call centres, those sorts of
36 overheads.
37
38 We have had a look at those benchmarks and
39 looked around for new benchmarks and there does not
40 appear to be a lot of new evidence to suggest that
41 those benchmarks are inappropriate or need to be
42 adjusted upwards or downwards. Retailers in their
43 submissions have forecast increasing costs and I
44 guess that is the same as with the original
45 determination, there was the same sort of profile, a
46 rise in operating costs.
47
48 The final point is that the range comes up with
49 the allowance. That depends heavily on the amount
50 of the FRC work that is going on.
51
52 The final point to talk about is the retail net
53 profit margin. That is the margin that covers the
54 return to capital of retailers. The current range
55 is between 1.5 and 2.5 per cent. That range was
56 based upon benchmarks established in other
57 jurisdictions and looking at those benchmarks and
58 looking around for new benchmarks there does not

.3/5/02 7

Transcript produced by ComputerReporters

1 appear to be other new information that has emerged
2 since the original determination which would suggest
3 it is appropriate to change those.

4
5 It was also based on the expectation that the
6 ETEF fund would be established and that would
7 eliminate energy purchase risks for regulated
8 customers, so that it would be inappropriate to
9 allow a margin to account for the risk of retail
10 energy purchase, wholesale energy purchase, given
11 that that has been absorbed by the ETEF fund.

12
13 The range of 1.5 and 2.5 per cent was also
14 based on a view that it is inappropriate from an
15 equity or economic efficiency point of view to
16 include an additional allowance to encourage
17 customer switching. Another consideration in that
18 range is that as FRC progresses it is likely that
19 the customer base will become more risky as there is
20 competition and the regulated basis drives lower
21 value customers. In that case it may be desirable
22 for the net profit margin to increase but I guess
23 that will determine the position within the range,
24 whether there is a shifting of the range, so really
25 whereabouts within the 1.5 to 2.5 per cent do you go
26 rather than shifting that range to a higher level?
27 At this stage of the analysis, there does not appear
28 to be much of a material case for shifting the net
29 margin range from its current levels.

30
31 The final question - this is something we
32 perhaps would appreciate any input on - is the
33 current split between fixed and variable costs in
34 terms of retail operating costs. Currently the
35 majority of those were covered through a fixed
36 charge. We need to consider whether there have been
37 any material changes or other considerations that
38 would suggest a shift in the balance between fixed
39 and variable components.

40
41 That, I guess, hopefully brings you up to date
42 on where our analysis is up to or heading in terms
43 of those components. We have still to do some more
44 work on the NEM fees and transmission and
45 distribution losses, so discussion would be useful
46 there.

47
48 MR COX: Thank you, James, very much. We will now
49 proceed to comments. Someone has to go first, so I
50 thought today I would ask Integral Energy to start.

51
52 MR NEVILLE: Thank you, and thank you also to IPART for
53 the opportunity to participate in today's forum. We
54 believe the outcome from today's discussion and the
55 report to the Minister will be quite critical to
56 supporting the ongoing development of the
57 competitive market in New South Wales.

58
.3/5/02 8

Transcript produced by ComputerReporters

1 If we go back to basics, the purpose of
2 electricity deregulation is to provide competition
3 and customer choice. That is customer choice for
4 all New South Wales customers, not 10 per cent of
5 the market, not 20 per cent of the market, but 100
6 per cent of the market. The systems and processes
7 that have been put in place by the industry reflect
8 the fact that 100 per cent of the market now has
9 that choice. We also believe that it is now
10 critical that the target tariffs that are in place
11 also reflect this fact.

12
13 The New South Wales Government has previously
14 stated that its three guiding principles for
15 deregulation of the industry are to protect
16 consumers' interests, to make sure a consistent
17 approach is taken nationally and that there is a
18 fair and equitable outcome for electricity
19 businesses. Integral strongly supports these
20 principles as the basis for promoting competition
21 and for reviewing the existing target tariffs. From
22 a regulatory perspective, we also believe it is
23 essential that the principle of cost reflectivity be
24 adopted in the resetting of the target tariffs,
25 otherwise it will be impossible to achieve
26 commercial outcomes which will be to the overall
27 detriment of the competitive market.

28
29 We have been asked to comment on material
30 changes and we note the comments from the Centre for
31 International Economics. We actually believe there
32 are a number of areas that have changed since the
33 original determination and therefore need to be
34 reviewed.

35
36 In relation to the long-run marginal cost, we
37 believe that new entrant retailers would have
38 difficulty in purchasing supply to match the shape
39 and volatility of the regulated market at the LRMC.
40 This is mainly due to the volatility of demand
41 within the regulated market resulting in additional
42 supply being required in peak periods rather than
43 flat across the day. It is our view that the LRMC
44 allowance within the target allowance should
45 accurately reflect the energy purchase cost for new
46 entrant suppliers.

47
48 On the green component, we have argued that the
49 current allowance of 1.5 per cent is insufficient.
50 We have maintained that view. Firstly, we don't
51 think that the 1.5 per cent allowance includes the
52 costs associated with the mandatory renewable energy
53 target as set by the Federal Government and,
54 secondly, as has just been noted, the guidelines for
55 implementing the mandatory CO2 omissions abatement
56 scheme have yet to be finalised and the full impact
57 of those measures has not been finalised. We
58 believe that the green component should be increased

.3/5/02 9

Transcript produced by ComputerReporters

1 to cover the additional costs associated with green
2 compliance.
3
4 On retail costs and net margins, we believe
5 that the benchmark set in the current determination
6 have been set too low. In setting the costs to
7 serve allowance, the original determination drew on
8 international benchmarks. We don't think it allowed
9 for the differences in market structure and size.
10 The UK has a substantially larger customer number so
11 efficiencies can be achieved that are not available
12 in a smaller market such as New South Wales.
13
14 We also believe that it is inappropriate to set
15 the retail cost component at the same level for all
16 regulated suppliers. Each supplier has its own
17 efficiencies and economies of scale which can lead
18 to market advantage being gained by much larger
19 retailers if a one size fits all cost to serve is
20 applied. We have also argued that the net margin
21 currently achievable from the regulated tariff is
22 insufficient to promote competition. Currently it
23 does not allow for savings to be offered to
24 customers while still allowing retailers to earn
25 sufficient returns given the risk involved in the
26 market, and those risks include the volume of loss
27 load at \$10,000 a megawatt hour. Without an
28 increase in the target tariff, the net margin
29 required to attract new entrants to the market will
30 not be available and competition and its benefits to
31 customers we think will be restricted.
32
33 On market fees, the regulated tariff is a
34 bundled rate that does not allow for the
35 pass-through of actual market fees as with
36 contestable rates. This poses an obvious risk to
37 retailers. We have reviewed the wholesale market
38 and our analysis indicated that the forward costs
39 for ancillary services, fees, where they are
40 tradeable are priced in line with the regulated
41 allowance. So based on this we support the
42 allowance for ancillary services being kept at its
43 current level.
44
45 We have also reviewed the appropriateness of
46 the split between fixed and variable components of
47 the target tariff and we believe that for the
48 tariffs to be cost reflective, the fixed component
49 needs to be a larger component of the tariff as a
50 result of the large fixed costs associated with
51 operating in the market. Thank you.
52
53 MR COX: I now move on to Macquarie Generation, Luke
54 Welfare.
55
56 MR WELFARE: Good morning and thank you for the
57 opportunity to speak.
58

.3/5/02 10

Transcript produced by ComputerReporters

1 I won't go back through our submission again.
2 The new information that has come to mind from your
3 discussions already is that we are concerned about
4 the level of green and how much money is to be
5 allocated for that. We have done our own modelling
6 based on the information that was supplied by
7 Treasury and, looking at it over the long run, for
8 what they would allow, we are looking at at least
9 double the costs that you have allowed there. We
10 are looking at the order of \$2 to \$3 a megawatt hour
11 and we will provide an additional submission to you
12 on that.
13
14 Also, it is a difficult position because you
15 are actually going to put a tariff in from the 1st
16 of August effectively without the full ramifications
17 of what is currently underdevelopment within the
18 Ministry of Energy Utilities and I think we need to
19 think seriously about what the outcome of that might
20 be because if you don't allow interstate trade,
21 which is some of the feedback that we are getting at
22 this stage, that rate could go to \$5 or \$6 quite
23 easily per megawatt hour. We will provide some
24 additional information to you and some modelling
25 that we have done to date as such.
26
27 MR COX: Thank you very much. We will now move on to
28 AGL.
29
30 MR KELLY: Thank you for the opportunity to speak. I
31 suppose I have some additional comments from the
32 perspective of new entrants into the market and
33 support the view that David made that the long-run
34 marginal cost of energy does not reflect the actual
35 market for the new entrant. Similarly, the
36 arrangements for the ETEF is also not available to
37 the new entrants and therefore that changes the risk
38 profile of a new entrant into the marketplace.
39
40 In terms of the retail costs, a particular
41 focus for a new entrant is that in winning customers
42 there is a significant acquisition cost that is
43 incurred in attracting customers to your business
44 and therefore we not only need to look at the
45 ongoing operation costs in terms of servicing a
46 customer over time but also the cost of that
47 acquisition.
48
49 Our experience to date is that that acquisition
50 cost, in terms of successful returns, can be of the
51 order of \$100. Similarly, if we flow that down
52 through into the FRC costs, it's important to
53 recognise that within the various energy markets, if
54 you take AGL for instance, which is obviously the
55 incumbent gas retailer, it doesn't achieve synergies
56 in a number of those FRC costs because the
57 arrangements in place for the electricity industry
58 have a different set of systems and rules than the

.3/5/02 11

Transcript produced by ComputerReporters

1 gas.
2
3 The incremental amount as to unencumbered, such
4 as AGL and gas, still incurs the full inventory
5 costs on systems for electricity. Similarly, when
6 we look at the net margin allowed on customers, what
7 we find is that instead of achieving the
8 Government's objective of opening competition to all
9 customers, it is severely restricting the number of
10 customers which would be potential candidates for
11 offers.
12
13 THE CHAIRMAN: Could we now move on to Country Energy.
14
15 MS TERRI BENSON: I am Terri Benson from Country Energy.
16 Country Energy believes, as has already been
17 outlined, that it is appropriate to revisit the R
18 because things have changed since it was set. We
19 will focus on financial aspects that we believe have
20 changed materially and to support this we need to
21 ensure that we do have cost reflective tariffs.
22
23 First of all, with respect to the green
24 component - we'll focus on that - that has probably
25 been the area where there has been the most change.
26 As outlined by James earlier, there have been
27 changes to the proposed New South Wales greenhouse
28 gas licence requirements. There has also been the
29 implementation of the MRT requirements.
30
31 Everyone has indicated, based on their
32 modelling, that they're getting numbers that are
33 higher than is the current allowed and our modelling
34 also shows that we would expect it to be
35 significantly higher than what is in that and we are
36 happy to provide that modelling.
37
38 With respect to the standard gross margin, we
39 have similar views to those outlined by David
40 earlier. We don't believe it is appropriate to have
41 one standard gross margin across all retailers.
42 That standard approach doesn't recognise the
43 different operating environments or economies of
44 scale possible for retailers with large customer
45 bases and also customer density.
46
47 With respect to Country Energy, which has a
48 significant real customer base, there is a degree of
49 responsibility and social obligation in providing
50 services to those customers who choose to stay in a
51 regulated tariff. It is a very different operating
52 environment. We have a dispersed customer base. We
53 think some of the retail component should be
54 recognised in the standard gross margin.
55
56 In terms of FRC cost recovery we've given,
57 subject to the final record, whatever are the
58 amounts that come out of that report should flow

.3/5/02 12

Transcript produced by ComputerReporters

1 through to the target tariffs, to ensure that those
2 cost tariffs are reflective of the costs of FRC.
3 There is one difficulty in including it in the
4 target tariff for that.
5
6 We say that if the allowance goes into the
7 target tariff, the only way those costs are
8 recovered are if the tariffs are at the target
9 level. If the tariffs aren't at the target level,
10 you're not recovering the FRC costs. That I think
11 reinforces the importance of transitioning those
12 existing tariffs to target levels, which would be
13 the subject of the next session. I will leave
14 further comment on transitioning to them.
15
16 In relation to the fixed and variable mix, in
17 Country Energy's case the fixed and variable mix is
18 constantly changing because we're going through a
19 lot of change at the moment. We believe the mix at
20 the moment is probably appropriate. However, with
21 the onset of FRC and as the customer mix changes,
22 that fixed and variable mix will need to change as
23 well. That is really all we have to say. Thank
24 you.
25
26 THE CHAIRMAN: Thank you very much.
27
28 MS TRISH BENSON: I must admit we feel as if we're
29 probably the only ones that are going to advocate
30 that we don't have higher prices, so I'll put that
31 on the table. Where we're coming from is we don't
32 actually support the premise that higher prices will
33 actually encourage competition.
34
35 The retailers need to think reasonably
36 carefully about this because they're still going to
37 have significant numbers of customers who are going
38 to remain with the incumbents and that will
39 particularly be households on low incomes and that's
40 for a variety of reasons.
41
42 If we actually contemplate price increases, I
43 think what we're going to have is profits for the
44 incumbents. It is our understanding that the way
45 competition has worked up until now is that the
46 incumbents in the main are signing their high usage
47 customers on to negotiated contracts. I think this
48 is borne out by some of the research that the
49 Ministry has done. They are signing up their high
50 usage customers and there hasn't been much change
51 between retailers.
52
53 Just a word of caution on the specifics. We
54 would like the Tribunal to think very carefully
55 about the greenhouse costs, particularly around the
56 MEU modelling. This is actually a two year
57 determination. The MEU modelling goes up to
58 2006-2007. There is a bit of concern there. We

.3/5/02 13

Transcript produced by ComputerReporters

1 take issue with Integral and their costs of service
2 model. We are really concerned about this. It is
3 not as if they're not recovering those costs. What
4 we're actually doing is smearing those costs.
5
6 If we start talking about getting people to
7 move on to less cost methods of payment, we might
8 end up with some people paying much more because
9 they don't have any other choice or options and
10 we're very concerned about that.
11
12 Within their submission Energy Australia raise
13 the issue about bad debt. We don't think they're
14 going to have any more than they've got now. We
15 actually don't think they should be compensated for
16 that in the retail tariff.
17
18 THE CHAIRMAN: Thank you very much. Could we now move
19 on to Eraring Energy.
20
21 MR BORAS: Our comments are more to be seen in the
22 context of the overall competitive energy market and
23 the implications we see with the end of retail
24 tariffs. The main concern that Eraring has is that
25 cross-subsidising between different classes of
26 customers under the one tariff jeopardises some of
27 the goals of the competitive energy market.
28
29 The particular issue we see there was touched
30 on earlier in the introduction, the fact that all
31 customers under the tariff are treated in a like
32 manner, assuming similar consumption patterns. That
33 is far from the reality. We believe that by
34 breaking it down into subclasses everyone would get
35 a much more accurate picture. Some broad
36 subcategories could be something like all electric
37 homes with off-peak water heaters but no gas and
38 others, all electric homes without off-peak water
39 heaters, homes with air-conditioning and so on.
40
41 Continuing with one tariff for all the
42 different customer classes would allow competitive
43 retailers to cherry pick the more attractive
44 customers as far as the load profile is concerned
45 and leave the retailers the unattractive part of the
46 tariff customers, which then leaves them to carry
47 the higher burden of costs associated with the less
48 attractive part.
49
50 From a generator's point of view, the
51 implications are as follows: currently the tariff
52 customer load risk is carried by the generators via
53 the mechanism that is known as ETEF. Again, the
54 generators need to put a generation capacity to
55 follow the load. If the general tariff load becomes
56 more spiky, less attractive, because the good
57 customers have wandered off to competitive
58 retailers, then we believe the reference energy

.3/5/02 14

Transcript produced by ComputerReporters

1 costs part of the ETEF arrangement would need to
2 increase.
3
4 Could I add just one word on long run marginal
5 costs, or just a general observation. There will be
6 increasing pressure on long-run marginal costs
7 coming from the need to put environmentally prudent
8 measures in place - cleaner technology, new power
9 station location, mandatory renewable energy
10 targets. Just recently, New Zealand introduced the
11 carbon tax. This has had an upward pressure on the
12 long-run marginal cost of generation and should be
13 signalled in the domestic tariff.
14
15 In summary, in light of the above, it is argued
16 that the tariff review should consider subdividing
17 the domestic tariff classes into a number of
18 subclasses with different cost characteristics and
19 should also allow for a program of tariff movement
20 in acceptable increments to cost reflective levels.
21 We believe that it would be consistent with economic
22 efficiency arguments and would help to promote
23 competition on a more level playing field.
24
25 THE CHAIRMAN: Thank you very much. Could we now move
26 to EnergyAustralia.
27
28 MR LEES: Thank you, Jim. With respect to the target
29 tariff situation, we see these target tariffs as a
30 mechanism but unfortunately this is probably the
31 most important part of the discussion we will have
32 today, because it doesn't matter what you set the
33 net margin range at and it doesn't matter what you
34 say side constraints are if target patterns aren't
35 cost reflective.
36
37 If they are set incorrectly it means we don't
38 get increases, even modest increases, and net
39 margin, whatever the range is, doesn't really
40 matter. The net margin range can be 2.5 or
41 10 per cent but we'll still get 1 per cent.
42
43 I won't buy into the argument about needing to
44 increase tariffs to assist competition. We don't
45 support that argument and we would agree with Trish
46 on that. All we're saying here is that these are
47 what the targets should be. We think they should be
48 cost reflective. That would give us a modest
49 increase in our tariffs per year, which would give
50 us a margin of about 2.5 per cent, not a
51 400 per cent increase. As Jim said, if I got
52 400 per cent I'd certainly get my bonus for the
53 year. I don't really think that that's where we are
54 with it.
55
56 Talking about the actual components of the
57 build up, first of all, we think there should be
58 different target tariffs for OP1 and OP2 because the

.3/5/02 15

Transcript produced by ComputerReporters

1 wholesale cost components are obviously different.
2 There should be different target tariffs for
3 business and residential because the operating cost
4 is different and the wholesale component is
5 different.
6
7 We don't just think that we should be talking
8 about what has changed since the determination, what
9 is the new evidence, as James called it, because we
10 don't think the IPART consultants got it right first
11 time. We are also harking back to a lot of what we
12 said at the last determination. Basically, I'm
13 trying to talk about benchmarks for the whole
14 industry. I will contradict myself a couple of
15 times on that because it's obvious we're only privy
16 to our own information.
17
18 With respect to long-run marginal costs, yes,
19 CAP Gemini did the modelling for IPART in the first
20 place and we got the same consultants to do it again
21 so as to try and pin it down to something narrower
22 than a range of 36 to 56. Obviously, that range is
23 problematic as well. It is so wide, what figure do
24 you pick within that range to actually develop your
25 target tariff?
26
27 At the time even CAP Gemini accepted for
28 Energy Australia - and I'm contradicting myself here
29 now - that the top 5 per cent, which would be the
30 peak load, is probably a bit low; remodelling that,
31 we'd get to 6 per cent. We also think the gas
32 purchasing price was low. Basically, that gives us
33 a long-run marginal cost of about \$49.
34
35 On top of that, you have to add the green
36 component. Yes, I am disappointed in what James was
37 saying about maybe 25 to 30 cents for the rack and
38 then more than 50 cents for jurisdiction. We are
39 disappointed with that. There were a lot of
40 assumptions in coming up with that 50 cents: that
41 there was full recovery of interstate, there was
42 effectively new generation and they were going to be
43 pricing at \$7 or \$8. I don't think that that is
44 going to happen.
45
46 Basically, we're going to price anything new up
47 to penalty. We'd work that out to be about
48 \$50 million a year over the next couple of years for
49 EnergyAustralia, which is \$1.55 which you'll have to
50 add on to the long run marginal cost to get the
51 wholesale cost in that sense. That is still within
52 CAP Gemini's range; it is still 36 to 56. It comes
53 down to what you think it should now be.
54
55 With respect to operating costs, again, I was
56 disappointed when James said he didn't think there
57 was any new evidence. We are now going from annual
58 licence compliance to quarterly compliance; that

.3/5/02 16

Transcript produced by ComputerReporters

1 must increase costs. There are green compliance
2 costs as well. There are significant green costs
3 that we have to absorb when trying to meet that
4 benchmark in terms of demand management initiatives
5 and in terms of trying to source this green
6 generation.
7
8 Forty to 60? Well, we don't want to say that
9 another jurisdiction is doing it better. We
10 modelled it and came up with about 65 to 70. As I
11 say, this is a State benchmark. Our operating costs
12 forecast is \$465 and as we're the biggest we should
13 be at the low end. I just don't think 40 to 60 is
14 reasonable.
15
16 David has covered ancillary services and other
17 transmission distribution. We have to remember that
18 our customers haven't had a price rise in two years.
19 We have a situation where if you live on one side of
20 Pennant Hills Road what you pay is significantly
21 different to what you would pay if you lived on the
22 other side. I want to emphasise how important
23 setting these target tariffs are. They dictate the
24 rest of the agenda.
25
26 The mix between fixed and variable and for
27 domestic is probably about right, except that
28 they're both too low. For business, no, the
29 business effect should be higher because they are
30 the ones which are going on to negotiate contracts.
31 They are the ones which are moving away and we have
32 to cover those fixed costs at the end of the term
33 for the ones which remain. Thank you.
34
35 THE CHAIRMAN: Thank you very much. Finally, sitting in
36 the corner, Gerry Egan from TXU.
37
38 MR EGAN: As you would know, we are a Victorian
39 retailer. We are interested in extending beyond
40 Victoria and have indeed extended into the
41 contestable market in New South Wales in a small
42 way. We see ourselves as a new entrant into this
43 New South Wales market, so that some of those
44 competition issues come up.
45
46 What we need to see is that the tariffs
47 actually paid by people are cost reflective. If
48 they are not cost reflective, if they are less than
49 cost reflective, there is no way a new entrant can
50 come in and compete for those customers and
51 competition may well not proceed as it should.
52
53 The cost reflectiveness that I'm speaking about
54 is the cost faced by a new entrant. We don't
55 believe that the long-run marginal cost argument as
56 implemented by ETEF does represent the cost faced by
57 a new entrant trying to enter this market, nor does
58 it represent the real cost to the industry.

.3/5/02 17

Transcript produced by ComputerReporters

1
2 Other speakers have spoken about the impact of
3 load shape and that is a most important effect. I
4 am sure customers in Victoria and New South Wales do
5 expect that electricity will be there when they want
6 it, even on the hottest summer day or the coldest
7 winter day. Capacity must be available to supply
8 that load. Someone has to pay for that capacity.
9 Ultimately, the customer has to pay for that
10 capacity.
11
12 Tariffs must be calculated in a way that
13 gathers the funds to pay for that capacity. When
14 you have plant megawatts required for very few hours
15 of the year, that can move your weighted average
16 cost up significantly.
17
18 In terms of what has changed, the load has
19 become more peaky, I understand - certainly we've
20 had that experience in Victoria - and that
21 exacerbates this capacity effect and hence moves the
22 long-run marginal cost upwards.
23
24 On the cost to serve area I would not have
25 mentioned the Victorian benchmark because I wouldn't
26 be game to do that in this audience; however, it is
27 probably relevant. We as a Victorian retailer
28 believe that benchmarking is difficult. Our
29 argument in Victoria for our own franchise base has
30 been that one should look at the actual costs
31 incurred and debate then perhaps whether there are
32 inefficiencies or not, but to start from some
33 difficult to determine benchmark can lead you in the
34 wrong direction, we believe.
35
36 We see that our costs are indeed higher than
37 what Energy Australia has just mentioned. We do, of
38 course, have a smaller number of customers and that
39 may well lead to some consistency there.
40
41 On the net margin question, any business needs
42 a return on its capital. The capital required to
43 run a retail business is significant and cost of
44 capital in electricity in many areas, but
45 particularly in the energy industry, has increased
46 markedly recently. We have had companies like Enron
47 causing banks to reflect on their investments, on
48 their exposure to the industry. We have had the
49 \$10,000 VOLL issue and the consequent prudentials,
50 again causing the banks to reassess their exposures
51 and we find our cost of capital is going up
52 noticeably.
53
54 If you need capital - and it does cost money to
55 get that capital - that must be reflected in the
56 margin. The risk can perhaps be lessened if you are
57 a party to ETEF or a retailer being supplied by
58 ETEF. That of course is not available to a new

.3/5/02 18

Transcript produced by ComputerReporters

1 entrant retailer. On the green area and on fees we
2 don't have anything to add to what has already been
3 said. Thank you.
4
5 THE CHAIRMAN: Thank you very much. I wonder if James
6 would like to comment on this stage.
7
8 MR BEARD: I want to comment on retail operating costs
9 margins. When I said there was no new evidence
10 regarding the margin, I was talking about benchmarks
11 rather than retail operating costs per se. I just
12 wanted to clarify that.
13
14 THE CHAIRMAN: Trish, perhaps we should let you come in
15 here.
16
17 MS TRISH BENSON: AGL and TXU have mentioned second
18 tier retailers not having access to the ETEF. I
19 would like to point out people with the incumbent on
20 contracts don't have access to ETEF either. I am
21 not sure if you actually understand how it works,
22 that's all.
23
24 MR BORAS: Would you say that again?
25
26 MS TRISH BENSON: I think I'm right in saying - and
27 someone from Treasury might have to tell me if I'm
28 wrong - that the second tier retailers keep making
29 the point that they don't have access to the ETEF.
30 The reality is that the incumbent retailers, who put
31 people on negotiated contracts, those customers
32 aren't in the ETEF either. That is the point I want
33 to make.
34
35 MR EGAN: I believe that you're correct. We may not
36 understand everything about ETEF.
37
38 MS TRISH BENSON: The Victorians have a hard time
39 understanding ETEF.
40
41 MR EGAN: I understand why customers are attracted away
42 from regulated tariffs to a contestable offer and it
43 will, I think, be those whose regulated tariffs are
44 already above or certainly at the cost reflective
45 area. We understand that there is a large bunch of
46 customers who are not yet at that target level and
47 even if they were, we don't believe that that's the
48 fully cost reflective position.
49
50 THE CHAIRMAN: I wonder if the members of the panel
51 would like to make further comments?
52
53 MR NEVILLE: Could I make a clarifying comment on
54 Integral's behalf? Trish raised the issue of the
55 payment process and what we had proposed in our
56 submission there and I just wanted to clarify what
57 we have actually proposed. There are various
58 payment methods available to customers in paying

.3/5/02 19

Transcript produced by ComputerReporters

1 their accounts, ranging from direct debit to
2 Australia Post, et cetera.
3
4 The cost per transaction for those that we've
5 noted in our submission ranges from 30 cents to
6 around \$4. That variation is not reflected in the
7 customers' account. We think there should be a
8 means by which the actual cost of those payment
9 processing costs should be passed through to
10 customers and we see that as a means of encouraging
11 customers to use the more efficient method, the less
12 expensive method and that is another way of reducing
13 the overall cost to serve.
14
15 MS TRISH BENSON: Can I reply to that?
16
17 THE CHAIRMAN: Yes.
18
19 MS TRISH BENSON: I didn't say it in my opening
20 statement. We were very concerned that the numbers
21 are actually confidential. We haven't got a clue
22 what costs 30 cents and what costs \$4. As I said
23 before, our main concern is that you recover those
24 costs anyway, as far as we're concerned. It is just
25 that it could be inequitable if some people don't
26 have the ability to move to least cost options; that
27 is all I'm saying. I am saying it is potentially
28 inequitable.
29
30 MR NEVILLE: Can I reply to that, Mr Chairman?
31
32 THE CHAIRMAN: Yes.
33
34 MR NEVILLE: That information is confidential because
35 obviously we're sitting in a room full of
36 competitors, but we are more than happy to sit down
37 with PIAC on a confidential basis and talk through
38 that information. The second point I'd make there
39 is that it is included in our cost to serve but
40 we've argued that our cost to serve is inadequate.
41
42 MS TRISH BENSON: You might say that.
43
44 MR NEVILLE: We have.
45
46 THE CHAIRMAN: From listening to the debate it seems to
47 me that from the utilities we're getting the
48 argument that what has been allowed, lower marginal
49 cost, isn't accurate. We are also getting the
50 argument that it is certainly not enough to enable
51 new retailers to come in and compete. From the
52 customers' point of view we're getting the argument
53 that well, if you were to move up to where the
54 utilities would like us to be, they would in fact be
55 rewarded for costs of actually running and making
56 handsome windfall profits.
57
58 Can anyone say anything that might try and move

.3/5/02 20

Transcript produced by ComputerReporters

1 the two sides together or do we simply have to
2 accept different views?
3
4 MS TRISH BENSON: Given that these debates have been
5 around and we indeed had this debate from the
6 formulation of the last determination, except the
7 line was more run by the second tier retailers than
8 the incumbents, I actually think it is up to the
9 Tribunal to be perfectly frank. That is part of the
10 balancing act.
11
12 THE CHAIRMAN: At the end of the day that is true. I
13 wonder if anyone can say anything to bring the sides
14 a bit closer together; otherwise, it does leave it
15 up to us.
16
17 MR LEES: Can I make a comment here about windfall
18 profits? We are asking for a CPI increase.
19 90 per cent of our costs are out of our control and
20 they go up by CPI. We are asking for a CPI increase
21 to pass through to customers. We are asking for
22 target tariffs to be set where we can have that CPI
23 increase. To us the CPI increase is important.
24
25 The CPI increase to our 3 meg an hour
26 customer - we'll call them our low income customer -
27 that's \$11, they are the ones we're worrying about.
28 We haven't talked about the re-balancing of peak yet
29 but even when we're trying to re-balance our peak
30 we're talking about \$17.
31
32 These aren't windfall profits; these aren't
33 extraordinary profits we're talking about. We are
34 talking about increasing Energy Australia's net
35 margin from 1 per cent to 2.5 per cent. This isn't
36 dot.com kind of stuff. We have to put in context
37 what we're actually talking about. If you ask the
38 man in the street whether he thought it was
39 unreasonable to have a 2.87 per cent increase in his
40 electricity prices, it's going to cost him on
41 average \$20. He is not going to think that that's
42 prohibitive. I think we have to think about that.
43
44 MR WELLSMORE: It may well be that the Tribunal has to
45 decide what that reasonable outcome is. Our
46 position is to put up ambit in the opposite
47 direction. One of the concerns that we have is that
48 the argument about unprofitable or loss making or
49 non-cost reflective customers is that that is an
50 argument we've heard in other regulated markets in
51 New South Wales of late as well.
52
53 An enormous proportion of our customers are not
54 paying a price which reflects the cost of supplying
55 those people. This was an issue last year and it
56 was an issue five or even 10 years ago. It seems to
57 be a bit opportunistic. As Trish mentioned last
58 time the regulated traffic was discussed, the second

.3/5/02 21

Transcript produced by ComputerReporters

1 tier retailers said, "Let's have a bit of head room
2 and we'll all jump in the market". Everybody else
3 suddenly discovered all of their loss making
4 customers and said, "We didn't realise they were
5 loss making for the last 10 years". From our
6 perspective, yes, we're happy to put up a
7 counterbalancing ambit. We will leave it to you,
8 Jim.
9
10 MR LEES: I think we're coming together there. What I
11 was trying to get across earlier was that really
12 everyone thinks what we're talking about is
13 reasonable. We shouldn't let the mechanism of the
14 target tariff drag us down until we're talking about
15 levels of detail that stop us getting to what
16 everyone thinks is a reasonable outcome. That is my
17 concern with the target tariff. Do you think we
18 should have target tariffs at all?
19
20 THE CHAIRMAN: It is a useful method of clarifying
21 matters. Does anyone have any further comments? I
22 might take comments and statements from people
23 sitting in the back of the room, if anyone wishes to
24 make one.
25
26 MR MARTINSON: Mike Martinson from EnergyAustralia. I
27 support all the comments Graeme made. I would also
28 like to put on the record that while it was
29 mentioned, in the context of the retail operating
30 costs, that there may be benchmarks out there that
31 have been factored in, clearly the benchmark that
32 has not been mentioned in this debate as yet is the
33 recent one of the ORG for the net margin, where in
34 New South Wales it's 1.5 to 2.5 per cent and yet,
35 the ORG, which is the one which has been out there
36 in the public arena, is 2.5 to 5 per cent.
37
38 People should be aware of the fact that there
39 are benchmarks and that probably the applicable one
40 is the ORG benchmark of 2.5 to 5 per cent. Thank
41 you.
42
43 MR BEARD: Could I point out that all the consultants
44 recommended that benchmark because it included an
45 allowance for energy wholesale purchase rates. That
46 has been specifically excluded from the New South
47 Wales thinking because of the ETEF. There is that
48 additional allowance and that risk.
49
50 MR EGAN: Could I comment on that? My recollection is
51 that the ORG attempted to capture all or nearly all
52 wholesale market risk in the benchmark cost of
53 energy, including all sorts of credit risk and stuff
54 like that and management risk. While there may have
55 been a little left over, the 2.5 to 5 was
56 predominantly to be regarded as being the margin for
57 operating a retail business.
58

Transcript produced by ComputerReporters

1 THE CHAIRMAN: Thank you.
2
3 MR KELLY: That is my understanding of how the Victorian
4 benchmarks were constructed. I support that view.
5
6 MR BEDFORD: My name is Greg Bedford and I am from
7 Treasury. Could I supply a bit of a follow up to
8 Mike's comment in terms of net margin. It is
9 worthwhile pointing out that the net margin can't be
10 looked at in isolation to what the allowed operating
11 cost is. It is certainly a 1.5 to 2 per cent net
12 margin if your operating costs are set too skinny;
13 in other words, you won't achieve that. That is an
14 already reasonably skinny margin.
15
16 From the Treasury's perspective it's fine to be
17 talking about appropriate net margins, but let's
18 make sure we get the operating cost targets right to
19 ensure that businesses will earn it. Thank you.
20
21 THE CHAIRMAN: Does anyone wish to make any further
22 comments? I suggest that we rule off this session.
23 Essentially, you have left it to the Tribunal to
24 decide between the points of view that have been
25 expressed at this stage. We might take a short
26 break now and resume at 11 o'clock.
27
28 (Short adjournment)
29
30 ACHIEVING TARGET TARIFFS
31
32 MR COX: I suggest we now resume for the second session
33 on achieving target tariffs. We might ask Michael
34 to introduce this topic.
35
36 MR SEERY: Thank you, Jim. I will be very brief on
37 this. As I said earlier, one of the things that the
38 Minister asked us to look at was whether the target
39 level currently undermines the competitive retail
40 market and, secondly, what are the impacts and
41 whether the side constraints should vary from where
42 they are now.
43
44 Before we start in that area, what we need to
45 do is understand what a target tariff is. Graeme
46 asked earlier whether Jim thought that there should
47 be a target tariff. I won't answer that question
48 but what I will say is ask what do we see a target
49 tariff is and how do you assess that target tariff.
50 In 2000 when the tribunal did the determination the
51 tribunal set targets in real terms. Certainly
52 looked at from that perspective, the target we set
53 is actually a number which will vary with inflation.
54
55 The target is there at the start of the period,
56 it is the same target at the end if there is no
57 inflation, and that needs to be remembered because
58 one of the questions that we get asked is when do

.3/5/02 23

Transcript produced by ComputerReporters

1 you have to achieve the target or when is that
2 target for. The point is that the target is the
3 same number if there is no inflation and if there is
4 no change in network tariffs. That is important.
5
6 Unfortunately the network tariffs do change,
7 therefore the target will vary a little bit and,
8 secondly, there is inflation, so the number will
9 change over time.
10
11 Those numbers that were set were set in 2001
12 dollars so, with inflation over the last period, the
13 target will move this year. Next year the target
14 will move again but it is only moving by inflation,
15 for no other reason.
16
17 What is the path for getting to the target
18 tariff. As you are aware, a number of tariffs are
19 under-recovering. A number of tariffs are
20 over-recovering. In the determination those tariffs
21 above the target level can't move. This is the
22 point Graeme made earlier, he has a lot of tariffs
23 that are currently above the target level and
24 therefore they can't move with inflation because
25 even with inflation they are still above the target
26 level.
27
28 Each year business has to assess whether the
29 tariff is above or below target. Then they can
30 increase the under-recovering tariff by CPI, if it
31 is a residential tariff, or by CPI plus 5 if it is a
32 retail tariff. Underlying that is the network side
33 constraints that overall the network tariff can
34 increase by CPI but the residential tariff can
35 actually increase by CPI plus 2 per cent or \$30.
36 Yet on the retail side, the tariffs can increase by
37 CPI for residential or \$25, so that the retail
38 tariffs are unable to pick up the difference between
39 the network and the retail side constraint.
40
41 One problem with the side constraints as they
42 are now is that this would mean that a number - this
43 is the point that Terry was alluding to - a number
44 of their tariffs are well below the target level and
45 because of the side constraints and CPI they can't
46 achieve that target level over the period.
47
48 What are some of the issues that need to be
49 considered in this area? I think one of the issues
50 that needs to be considered, and there has been a
51 bit of a question over what the answer is, is how do
52 you assess if you have reached the target tariff.
53 Is it based on the components? In other words, if
54 your fixed charge is less than the fixed charge in
55 the target then your usage charge is less than the
56 usage charge so are you below target, or is it based
57 on a total revenue approach?
58

1 Another issue is how do minimum charges fit
2 with the concept of target tariffs. A number of the
3 retailers still have minimum charges and do they
4 necessarily fit in with this concept of a fixed
5 component and a usage component only?
6
7 Probably one of the most contentious issues is
8 to what extent are side constraints limiting
9 achieving targets and in this regard are there some
10 innovative ways of using the side constraints. I
11 think in Country Energy's submission they have
12 suggested that they use what they termed a tiller to
13 increase tariffs by CPI but effectively rebate
14 customers who have reached the side constraints.
15
16 The question then is, perhaps there is scope
17 for the side constraints to be relaxed. In other
18 words, rather than being a CPI side constraint,
19 perhaps it could be a CPI plus 1 or more side
20 constraints?
21
22 Finally, does the fact that some tariffs are
23 below target impact on competition? We had some
24 discussion about that earlier. This is a concern
25 that PIAC had, that not all customers are likely to
26 become contestable, and this is because their
27 consumptions are so low that a competitive retailer
28 would not be able to offer them a competitive
29 contract.
30
31 They are basically the issues that need to be
32 considered in this session.
33
34 MR COX: Thank you, and I will ask Graeme Lees to lead
35 off.
36
37 MR LEES: If we take the EnergyAustralia view of where
38 we would all be by now, everyone has accepted that
39 all the targets have been rebalanced, the optimum
40 view as Jim said, you are right, we don't need these
41 target tariffs and we threw them all out altogether.
42 We can only talk about this in the context of having
43 appropriate target types. EnergyAustralia thinks
44 there should be different target types for
45 residential and business and they should be cost
46 reflective, so we make the assumption that is where
47 you set them.
48
49 Under that assumption, side constraints are as
50 they are, we are quite happy with them, we think
51 they are reasonable and we think there is obviously
52 good reason why they should be there. The only
53 thing is that where there is a resetting of the
54 target it is also logical that you relax the side
55 constraints to try to get that target. If you adopt
56 our principle that the OP2 target isn't cost
57 reflective because of the long-run marginal cost
58 issue, you should be able to relax the side

1 constraints to allow us to get to that target within
2 a reasonable period, otherwise you get the situation
3 where you have targets set right but you have never
4 got any chance of getting to the targets.
5
6 Just talking about the off-peak issue, I think
7 everyone accepts that those tariffs aren't cost
8 reflective. What we should get to the idea is that
9 off-peak customers are also low income customers,
10 because they are not. Jim is an off-peak customer,
11 Mike is, we know that --
12
13 MR COX: I told him.
14
15 MR LEES: We don't have dossiers on them! They are not
16 that because they are low income earners, so we
17 should not have the argument of you cannot increase
18 off-peak by more than the side constraints because
19 it will penalise low income customers. If you want
20 to protect low income customers, which are a
21 different subset to low peak but do overlap, you
22 have to have something else in place to protect them
23 because what we are trying to do with these off-peak
24 customers is not to make windfall profits from them
25 by increasing the charge to them, what we are trying
26 to do is give them the incentive to do something
27 else. Jim and Mike would get gas connected if it
28 was cost effective to do so because they have got
29 gas down their streets. That is what we are trying
30 to do.
31
32 By leaving it where it is and not bringing it
33 up to where it should be, you have the issue. It is
34 contrary to what we are trying to do or the
35 Government is trying to do with green, send the
36 right messages, because basically we don't want the
37 off-peak component to go up so we make more money
38 out of them, we want it to go up so we can give them
39 gas or solar. We are also happy for them to stay
40 with gas. The green penalty on the off-peak is
41 exactly the same as on general supply and that is
42 really the issue.
43
44 Basically the only other thing I want to say
45 is, does the target tariff hinder competition. I
46 don't know. Certainly if it is set incorrectly, it
47 does. No one would dispute that. If it is set
48 correctly, I don't really have a view on that, but
49 you have to set them correctly.
50
51 That is all I wanted to say.
52
53 MS HARMAN: We will address briefly the issue of if you
54 have target tariffs set appropriately, side
55 constraints necessarily will impede actually meeting
56 those tariffs anyway, and in regard to that, for
57 reasons of cost reflectivity, we support them being
58 relaxed. We certainly recognise the balance between

.3/5/02 26

Transcript produced by ComputerReporters

1 tariffs being set at an appropriate level and the
2 safety net issues and see that as a transition
3 period as well.
4
5 We would encourage the transition to be
6 happening sooner rather than later, and it leaves a
7 rather important issue that I am sure PIAC would
8 like to address, the low income consumers. We see
9 that as being addressed largely through two
10 different manners: one is the social obligations or
11 CSOs which we believe should exist but, two, is also
12 the responsibilities on the energy industry to come
13 up with an innovative solution to that and
14 innovative products to meet the requirements of
15 those customers.
16
17 MS WALDMAN: I would like to start with the target tariff
18 and support TXU. In the words of the original IPART
19 determination, the target tariff is based on the
20 costs of supplying electricity and so therefore it
21 should cover that cost. In practical terms the
22 current target tariffs set for Integral do not cover
23 the costs of supplying electricity to all customers
24 and they do not provide an adequate allowance for
25 cost to serve.
26
27 So while we agree with the definition of what a
28 target tariff is, current arrangements which have
29 entrenched under-recovering tariffs do not reflect
30 this definition. In terms of actually improving the
31 definition of what a target tariff is we believe it
32 should be expanded to cover the cost of supply and
33 also include a sufficient net margin to cover the
34 risk associated with the competitive market.
35
36 As far as the path to target tariffs goes,
37 given that we believe they are too low and they need
38 to be increased and that we are going through this
39 process in order to test the building blocks, the
40 elements, we believe this needs to be urgently
41 addressed and that we do need to establish an
42 appropriate commercial return for the retail sector
43 and therefore promote wider competition in the
44 market. Our view in relation to the path is that
45 IPART should provide the scope for retailers to move
46 from the current and often under-recovering tariffs
47 to new increased tariffs from the next retail price
48 adjustment date of 1 August 2002.
49
50 In relation to the side constraints, again we
51 actually agree with TXU that there are two issues
52 associated with the side constraints in achieving
53 those target tariffs. Firstly, there is the current
54 asymmetry between the network and the retail side
55 constraints which effectively means for retail
56 tariffs below target they cannot be increased to
57 achieve that target level and in fact where the full
58 network side constraints pass through the

.3/5/02 27

Transcript produced by ComputerReporters

1 under-recovering retail tariff moves further away
2 from the target.

3
4 The second point in relation to side
5 constraints is that it provides for efficient
6 transfer to those new target tariffs from 1 August
7 and we recommend that IPART allow a relaxation of
8 the side constraints to enable the current target
9 tariffs to efficiently transfer to any new increased
10 target tariffs in the competitive marketplace.

11
12 As far as whether the target tariffs hinder
13 competition, I think however you define it we agree
14 with EA, that they are not set correctly so in some
15 way, because of that, whether they are rebalanced or
16 they are inappropriate, at that point they are
17 hindering competition and that from an overall
18 industry perspective new entrants will be reluctant
19 to enter the market based on those current target
20 tariffs if there is insufficient margin to recover
21 their costs. This can only be addressed by
22 increasing the target tariffs and allowing new
23 entrants to move to those as quickly and efficiently
24 as possible.

25
26 MR WELFARE: I probably don't have a great deal to say
27 other than I prefer Jim and Mike to stay on
28 off-peak. If you actually think logically about
29 that, if people move to other forms of energy
30 outside the off-peak range that they have, it is
31 likely to become more peaky and as a generator we
32 will have to buy the bits of junk that cover that
33 load shape. They are expensive and if the rates are
34 not set correctly and do not reflect it all the way
35 back to the producers, the lights will eventually go
36 out because we will not be able to fund the purchase
37 of the bits of junk that supply energy in the long
38 run.

39
40 MR COX: We might now move to AGL.

41
42 MR KELLY: Our position is obviously that we support any
43 arrangements which allow flexibility in pricing to
44 customers but recognising that in consideration of
45 the target tariffs there are really three aspects
46 that need to be considered. One is obviously the
47 level of the target tariffs, two is the actual time
48 taken to achieve those target tariffs and in that
49 consideration there is obviously the impact of the
50 side constraints on the timeliness of that
51 achievement balanced against the social aspect of
52 any price shock to customers. And the third step
53 that needs to be considered is the extent of any
54 embedded cross-subsidies in those target tariffs,
55 how we actually get to the position where we get
56 cost reflectivity in the tariffs.

57
58 MS TERRI BENSON: As Michael highlighted at the

1 beginning, side constraints and transition tariffs
2 are probably a key issue to Country Energy. We are
3 in the position where we have a significant number
4 of tariffs below the target and therefore transition
5 tariffs to the target level is important for us.
6 For us the target tariff is the tariff that
7 represents the cost to supply and it should ensure a
8 commercial return to the retailer. It should also
9 achieve equitable pricing across all customers and
10 it should not undermine competition.

11
12 As came out during the last session, it is a
13 huge balancing act for a tariff to do all those
14 things and often each of those things are in
15 conflict, so trying to get a balance is difficult.
16 However, if we agree that the target tariffs are
17 appropriate and that they have been designed and
18 send the appropriate pricing signals, the tariffs
19 need to get the target levels.

20
21 We support the transitional approach in the
22 determination. We have also maintained that it
23 would be inappropriate to suddenly introduce target
24 tariffs and have price shocks to customers.
25 Therefore we support the transitional approach.
26 However, we probably would like more flexibility on
27 the side constraints in order to get there. The way
28 the side constraints work at the moment is that our
29 tariffs won't get to the target.

30
31 We believe that relaxing the side constraints
32 won't mean price shocks, it can still be managed in
33 a way that customers will not be impacted adversely.
34 At the moment the way the side constraints work is
35 that at the customer level it only takes one
36 customer in your model to breach the side constraint
37 and you are impeded from the whole tariff. It is
38 that inflexibility that makes it difficult for
39 transitioning tariffs.

40
41 The other point with the side constraint is the
42 disconnect to the network side constraint which
43 Karen already has mentioned. If networks utilise
44 their CPI plus 2 per cent or \$30, effectively there
45 is no room for the retail price to move at all, the
46 whole side constraint is taken up.

47
48 On the question of does the tariff hinder
49 competition, if tariffs are not cost reflective
50 obviously competition would be undermined because it
51 is difficult to offer a customer a better price.
52 However, there is a trade-off, as we talked about
53 before in the balancing act, in transitioning the
54 tariffs to meet the full cost of supply, to balance
55 the interests against competition and therefore
56 ensure customer choice isn't reduced. However, the
57 longer that transition takes in recognising the
58 balance the larger the risk to retailers because as

1 customers churn away on the more profitable tariffs
2 the mix of non-cost reflective tariffs to the
3 retailers increase, therefore affecting
4 profitability for the retailer, which we think
5 should be borne in mind.

6
7 In relation to the approach to determining
8 whether a tariff is at target or not, whether you
9 take a component approach or average cents per
10 kilowatt hour, this is something we have grappled
11 with because we have a range of tariff structures,
12 probably every combination you could possibly want,
13 or not want, and we believe that for us it should
14 depend on the impact on customers and it should not
15 be a question of how to interpret that. Whatever
16 achieves the transition to a target level is the
17 more appropriate way of treating it. If that means
18 for some tariffs that are not in a fixed and
19 variable structure, the average cents per kilowatt
20 hour should be applied; if the existing structure of
21 the tariff means we can achieve transition in a
22 component approach, that should be the preferred
23 approach, but we don't think to make one rule will
24 be appropriate.

25
26 MR COX: Thank you. PIAC?

27
28 MR WELLSMORE: There may well be an argument to treat
29 things like off-peak differently in the setting of
30 the targets and the setting of side constraints. I
31 don't think we baulk at that idea at all. We still
32 have the debate about what was going to be the
33 appropriate treatment for OP1, off-peak, but
34 certainly you could treat them in different ways.

35
36 The question I am still unclear about is when
37 off-peak was being discussed in the retail
38 submissions, how it is that off-peak apparently is
39 so far below where it is supposed to be or needs to
40 be? I am not sure how we got to the situation where
41 off-peak is so damned cheap. I assume there is some
42 historical explanation for that. I don't know what
43 it is, I wasn't around at the time, but that is a
44 historical factor that has to be borne in mind when
45 talking about side constraints and target tariffs
46 and transitions.

47
48 We see a side constraint being a social policy
49 issue. Obviously the debate here - side constraints
50 has been raised in relation to the speed of the
51 transition to the target tariffs. We think it is
52 crazy to have different tariffs, people on one side
53 of the street paying different to the people on the
54 other side. However, from our situation, there are
55 400 or 500 different tariffs out there. Where did
56 they come from? They came from the situation of
57 making a decision about what the tariff is. Now
58 people are saying, customers have to see reason and

.3/5/02 30

Transcript produced by ComputerReporters

1 they have to accept all manner of individual
2 negotiated rises in their prices, and how are
3 customers, households or groups of households or
4 classes of customers, really supposed to be able to
5 debate the appropriate rate of transition for them
6 towards the target tariff? You are asking a lot of
7 the community really.

8
9 That is where you come back to the idea about
10 side constraints being a form of regulation that
11 actually comes from the view of saying, let's have
12 some social policy at work here. The thing about
13 the target tariffs from our perspective is really
14 whether or not over the long term the businesses are
15 earning the right or the reasonable or appropriate
16 or earning some amount of money from their customers
17 to allow them to do the things they need to do, so
18 in other words the target tariffs should not be set
19 at a level where a business will go bust or not pay
20 their dividends to Treasury - because everyone likes
21 dividends to Treasury going to houses and schools
22 and those sorts of things - so if you take that as a
23 given, we have not heard the argument that that is
24 not occurring, that target tariffs will force people
25 out of business, so we are back to the argument of
26 Trish before, there is always going to be some
27 cross-subsidy, you can't unpick them, some level of
28 smearing between people.

29
30 Essentially that is what the target tariffs are
31 supposed to be doing over time, I guess taking that
32 smearing is a given and saying, instead of having
33 lots of small groups of customers with smearing
34 within them, let's have a smaller number of groups
35 and have smearing in there. Either the total costs
36 are being recovered or they are not. Some customers
37 may be returning more, some may be returning less,
38 but that is always the case it seems to us in any
39 event.

40
41 So, lastly, the issue of new entrants. I am
42 sorry, you won't get much joy from us on that. We
43 said two years ago, look, it astounds us I suppose
44 that people could suggest that incumbent or
45 regulated customers who are probably never going to
46 move to a negotiated contract, whether because of
47 choice or they are just not attracted to the second
48 tier retailers or whatever, that those people ought
49 to be somehow carrying costs or carrying a burden in
50 order that the second tier retailer can operate and
51 that it looks a lot more pleasurable for those
52 people that will change. I can't think of another
53 market where that argument would get up. Anyway,
54 that is us for side constraints.

55
56 MR RAY: I guess from our point of view side constraints
57 are a major problem as well. The issues of
58 asymmetry between the network and retailers have

.3/5/02 31

Transcript produced by ComputerReporters

1 been discussed but it is a bit wider than that. The
2 retail limit also includes GST so there is a
3 narrowing of the margin between the \$30 for the
4 network and the \$21.70 or whatever it is for retail.
5 We are at a time now where there is a cessation of
6 derogations on insurance pricing which will allow us
7 to approach the tribunal for possibly increasing
8 greater than CPI for network price increases.
9 Obviously if that occurs that will put further
10 pressure on the retailer in not being able to move
11 their tariffs so we are at a point of time where we
12 need to increase network prices to recover increased
13 costs, but at the same time the retail side of the
14 business also needs to make a profit, service
15 customers and pay dividends, and we are an
16 integrated business so that is an issue.
17
18 Certainly if the overall limit is what the
19 retailer sets out on the bill then they will get
20 further squeezed as the networks recover the cost.
21 Certainly from our point of view the immediate
22 problem is side constraints and trying to recover
23 adequate revenue.
24
25 In analysing our tariffs, we've looked at a
26 number of these. Some are below the target level,
27 some are above and some have got a cross-over point
28 in between. The question is how do you determine
29 it? Do you shift your block arrangement so that
30 the under-portions don't get up to the target level?
31 Do you, as has been suggested, increase it and then
32 do a rebate system? It depends on the flexibility
33 of your CIS systems in doing a rebate determination,
34 whether you do it on a monthly calculation, on a
35 rolling 12 months, or on a 12 month block. There
36 are a number of ways of doing it provided your
37 billing system has that capability.
38
39 Side constraints is certainly an issue we're
40 grappling with and it's going to become more of an
41 issue. I would certainly agree with the points made
42 before by Country Energy about the definition of
43 target tariffs and whether target tariffs hinder
44 competition. Retailers have to be able to provide a
45 service and a product to customers and they need a
46 return to be able to do it. I think target tariffs
47 need to be at an appropriate level.
48
49 THE CHAIRMAN: Are there any further comments from
50 members of the panel?
51
52 MR LEES: Jim was saying that in the past businesses
53 made mistakes and didn't increase tariffs when they
54 could have and that's maybe why some of the off-peak
55 tariffs with some of the businesses are not what
56 they should be. Yes, we've done that but we're not
57 embarrassed by that. Companies don't necessarily
58 make the right decisions but that is no reason to

.3/5/02 32

Transcript produced by ComputerReporters

1 not redress that situation until the end of time.
2 That is really all we need to say about that. It
3 doesn't matter what the reason was. These cost
4 reflective aspects need to be addressed.
5
6 THE CHAIRMAN: Are there any further comments at this
7 stage? As I see it, everyone seems to be agreeing
8 that side constraints are needed. Everyone seems to
9 agree that there's a balance between getting the
10 tariffs in a reasonable time and protecting the
11 customers. The essence is that that balance should
12 be shifted towards faster recovery and that there
13 should be more flexibility in how the side
14 constraints are applied to tariffs.
15
16 As I understand it, that seems to be the crux
17 of what people are saying. Are there any comments
18 on those questions?
19
20 MS TRISH BENSON: Can I say something?
21
22 THE CHAIRMAN: Yes.
23
24 MS TRISH BENSON: I haven't read all the submissions in
25 detail but it might be worthwhile hearing from
26 retailers. The complaint about the tariffs is that
27 they're not going to recover costs or those that are
28 under-recovering aren't going to recover costs
29 during this determination. My assumption is that
30 they'll get there eventually. I would like to make
31 that point.
32
33 What I would like to know is the proportion of
34 tariffs compared to those that are over-recovering
35 that won't meet the target by the end of this
36 determination, which is two years' time. The social
37 policy stuff is really important. Maybe we should
38 just keep cross-subsidies. I think we should debate
39 that point.
40
41 THE CHAIRMAN: Does anyone want to respond to that?
42 The main points are how much under-recovery tariffs
43 are likely to be and how important they are likely
44 to be in the period. There is the factual issue and
45 there's the balancing issue of social policy so as
46 to get to the recovery level in a reasonable time.
47 Maybe people don't want to speak in specifics about
48 that. Maybe someone would like to speak about that.
49
50 MR LEES: I said at the start I thought we had to
51 progress in the context that we accept the targets
52 have to be reset and then you can talk about what
53 side constraints you need to get. Even in that
54 context for EnergyAustralia it's only the off-peak
55 ones that we have to increase by more than the side
56 constraints to get to the target tariff by the end
57 of the determination. If you don't reset the target
58 tariffs, heaven forbid, we're talking about a

.3/5/02 33

Transcript produced by ComputerReporters

1 one-off peak 1. The other ones are above target
2 anyway; they won't increase at all. I don't mind
3 saying that. That is the only comment we have.
4
5 MS WALDMAN: I am happy to reply in a general sense. We
6 go back to our original principle and the principle
7 is that we're here to provide competition and
8 customer choice and therefore, you have to look at
9 how this target tariff issue is hindering that from
10 a customer, an individual business and an industry
11 perspective.
12
13 From a customer perspective we're saying
14 there's really not sufficient head room to encourage
15 competition and so they are going to be limited in
16 their choices. Where that impacts on the price and
17 issues of price shocks, we're happy to work with the
18 Tribunal to minimise the impact of that and to
19 consider that.
20
21 EA referred to the sorts of CPI increases that
22 you're looking at to go up in this area. In
23 relation to the individual businesses themselves,
24 there's only so long that you can supply electricity
25 below cost and remain viable for survival in the
26 industry.
27
28 From an industry perspective, if we are about
29 competition then there has to be a mechanism by
30 which you can encourage entrants to enter the
31 market. If you look at the full stakeholder
32 perspective, it is a balancing act. You can't
33 continue to supply a low cost product.
34
35 MS TERRI BENSON: From Country Energy's perspective, our
36 modelling shows that transitioning tariffs will
37 probably be 60 to 70 per cent still below target at
38 the end. That is with the current side constraint,
39 which is one reason why we've been trying to look at
40 other options of transitioning those tariffs.
41
42 In our submission we have alluded to this
43 rebating system at the customer level, but it does
44 depend on CIS and that's trying to stop the existing
45 side constraint which applies at customer level,
46 stopping tariff level adjustments occurring, but
47 that's so we can work within the current side
48 constraint where flexibility on that current side
49 constraint would save us a bit of money on changing
50 the CIS.
51
52 MR RAY: I think our off-peak tariffs are the ones that
53 are probably undercovered. There would have to be
54 significant price increases to achieve the target by
55 the determination. Similarly, because you can't
56 have an off-peak tariff in isolation, it is part of
57 your total package of having a primary tariff as
58 well.

1
2 At the end of the day you're still limited to
3 the annual increase, if you decide not to move your
4 primary tariffs, as to how far you move the other
5 one. Your off-peak tariffs are not your main
6 consumption. It is going to be very dramatic across
7 all the customer bases.
8
9 THE CHAIRMAN: Are there any further comments or
10 suggestions from the back of the room? It seems to
11 me that you have left us with a balancing act:
12 that's kind of you. We might move on to session 3
13 on regulated retail tariffs. I think Michael has
14 some comments to make on that .
15
16 MR SEERY: Thank you, Jim. As I referred to earlier,
17 the third block of terms of reference related to
18 whether there should be any new regulated retail
19 tariffs and secondly, it looked at the issue of
20 off-peak tariffs, including the merits of a shoulder
21 tariff.
22
23 As I said in my opening comments, a regulated
24 retail tariff is led to be a plain, manila,
25 non-fancy tariff. That raises the question of how
26 many regulated retail tariffs there should be. As
27 Country Energy noted, they currently have over 300
28 regulated retail tariffs, which is in part or
29 largely due to the fact that Country Energy is an
30 organisation that has been created out of a large
31 number of smaller distributors, as they were called
32 in those days, and these distributors haven't been
33 able to get those tariffs to a common scale, even
34 when they are still three separate businesses. It
35 has become harder for them now that they are one
36 business.
37
38 Ideally, there should only be a few regulated
39 retail tariffs. Also, choice should be an issue for
40 negotiating contracts, not for the regulated retail
41 tariff area. The issue we need to look at here is
42 why should there be new regulated retail tariffs?
43 Is it because of changes in the network tariff
44 structures? For example, the time of year
45 structure may change or something similar. Maybe
46 there's an issue in that case.
47
48 Is it a green issue? Is it trying to pick up
49 the green environmental-type structure? Green
50 premiums have for a long time not been regulated by
51 IPART. Is it to provide choice? It is my view that
52 regulated retail tariffs are not the place for
53 choice: that is for the negotiated environment. Is
54 there some other reason that I haven't thought of
55 yet?
56
57 The question, of course, is under the
58 Electricity Supply Act the Tribunal determines

1 regulated retail tariffs in a determination. We
2 will be going through a new determination phase in
3 the next month or so. What if someone wants to have
4 a new regulated retail tariff outside that
5 determination? How can that be achieved under the
6 current framework? I don't think it is possible.
7 That means that people, if they have to have new
8 tariffs for some reason, need to fit them within the
9 framework that we have at the moment.
10
11 The other issue relates to the variable R and
12 whether and where off-peak fits into that.
13 Currently we have a variable R for peak and for
14 controlled flow but off-peak too. A controlled flow
15 product is sold in the off-peak period and in the
16 peak period and there are questions about whether
17 the current variable R applied to off-peak 2 is the
18 appropriate level and that is the standard off-peak
19 usage price; that is certainly an issue.
20
21 The other issue relates to timing these tariffs
22 and, as I said, in the terms of reference it
23 requires us to think whether there should be a
24 separate shoulder tariff.
25
26 The question probably is should the current
27 control load R, variable R, be used in the final use
28 tariff or should all of the R components in the time
29 and use tariffs be the one value, that is, the peak
30 value? They are some of the issues that relate to
31 this particular session.
32
33 THE CHAIRMAN: Thank you. I might open it up for
34 discussion. Perhaps we could ask Country Energy to
35 lead off.
36
37 MS BANICEVIC: My name is Natalie Banicevic and I am
38 from Country Energy. I will start with what is a
39 regulated retail tariff? Country Energy believes
40 that the current transitional existing prices should
41 reflect the price of supply and eventually they
42 should mirror the target tariff. It is also a
43 safety net for consumers who choose not to compete
44 or are not in a position to compete or opt back from
45 the competitive market.
46
47 Should new regulated tariffs be introduced?
48 We believe they should, particularly if a new
49 network tariff is introduced, because effectively
50 you'll have a new target with no retail tariff to
51 match it.
52
53 The creation of new products outside your plain
54 manila product, as Michael alluded to previously,
55 should be left to the competitive market where there
56 is scope for innovation and new ideas.
57
58 In relation to new R components, off-peak 2 is

1 different to off-peak 1 in many ways and really is
2 not representative of the current controlled load
3 tariff. Some of the off-peak 2 tariffs in our area
4 can actually run up to 20 hours and compared to
5 off-peak 1, which is only 7 hours, we've got a big
6 mismatch there between the peak and off-peak price
7 you pay under ETEF.
8
9 This ultimately sends incorrect price signals
10 to customers and eventually off-peak 1 and 2 will
11 come closer together, with really the only
12 differential being the network price, which is
13 slightly more but it is not enough compared to what
14 you pay with your peak and off-peak prices in ETEF.
15
16 The introduction of a shoulder target we feel
17 is not really representative of the cost of supply
18 because the targets should be representative of the
19 costs of supply. Because there isn't a shoulder
20 period in the ETEF is not really a reason to
21 introduce the shoulder target. Again, the
22 differential in the shoulder period of a retail
23 price is driven by the network price, not the ETEF.
24
25 If the ETEF were to change my peak shoulder
26 off-peak type approach, then there's room, I
27 suppose, for the target to reflect that, but at the
28 moment we are in a peak and off-peak type
29 environment and really there's not a lot of scope
30 for a shoulder component. I think that is pretty
31 much all I wish to say.
32
33 THE CHAIRMAN: Thank you. I will move on to PIAC.
34
35 MS TRISH BENSON: I don't know if we've actually got
36 much to say about this section. I suppose a couple
37 of points should be made. It was always our
38 impression that in this process we would try to
39 rationalise the number of tariffs and now we're
40 talking about having new tariffs.
41
42 It sometimes worries me a bit. That was
43 obviously one of the original objectives of the
44 determination. It would seem to me that the price
45 rises people are talking about around off-peak hot
46 water systems may not actually achieve the
47 objectives of switching to another fuel source.
48 That is my comment, particularly when and indeed
49 EA's price increase might be larger than \$17 a year.
50 I am not sure, Jim, whether you would switch to gas
51 or solar because you're charged \$17 a year more.
52
53 MR LEES: We should be charging more, shouldn't we?
54
55 MS TRISH BENSON: That is a point we often make, that
56 price signals are a pretty blunt instrument and they
57 have to be actually very, very large to change
58 people's behaviour. We would like to make those

1 points.
2
3 THE CHAIRMAN: Thank you. Adrian?
4
5 MR RAY: Jim, I think there should be scope to introduce
6 new tariffs, even if it is purely to obsolete or
7 simplify an existing range of tariffs. I don't
8 believe that a determination should lock in a
9 particular set of tariffs over a long period. The
10 obvious other thing is to provide greater customer
11 choice or a range of products to customers.
12
13 One of the points that should be brought out in
14 relation to off-peak tariffs is that they are used
15 in both residential and business. There are
16 different both in urban and rural. We often tend to
17 focus on the low income residential customers but
18 off-peak 1 and off-peak 2 tariffs are available to
19 both classes of customers, business as well, and
20 there are different side constraints applying to
21 those.
22
23 Again, we have asymmetry there between what we
24 might be able to do with an off-peak tariff that was
25 purely targeted to business, versus one that is
26 purely targeted towards residential. They are both
27 coming from generation and obviously from the same
28 marginal costs.
29
30 In terms of whether there should be a shoulder
31 tariff or separate Rs, I'm not quite sure whether by
32 saying that we introduce a shoulder tariff you're
33 implying that we've got to be able to measure it,
34 which implies time and use metering or profiling or
35 some other method. In a lot of cases - I would have
36 thought in most times - we're probably looking at
37 trying to operate the market, at this point in time,
38 with basic metering and all of the vagaries and
39 problems with profiling.
40
41 I am sure as time goes on and we get the
42 availability of more cost effective and time use
43 metering, we could do a whole range of things and
44 offer a greater range of product to customers at the
45 right price, but I don't necessarily agree that we
46 should be sort of running out to introduce shoulder
47 tariffs.
48
49 There may be good opportunities if the
50 technology is there and the market retailers have a
51 particular package to offer, but I mean it can
52 create some problems as well.
53
54 THE CHAIRMAN: Thank you. Graeme?
55
56 MR LEES: Should new regulators be introduced? I can
57 see all the arguments why you wouldn't when you have
58 a huge amounts of tariffs. I don't want to say I

3/5/02 38

Transcript produced by ComputerReporters

1 don't think we should close the door and say
2 definitely no. I think anything should be looked at
3 on its own merits: for instance, network time of
4 use tariffs and a passing on of retail time of use
5 tariffs. I don't know how that would work. I don't
6 know how the networks would impose a retail cost,
7 whether it is tier 1 or tier 2.
8
9 I think we should keep the option open that any
10 of these things should be looked at going forward,
11 because there might be some fantastic management
12 initiatives that come forward over the next couple
13 of years. We don't want to close the door and say
14 we can't go ahead with that.
15
16 Green, yes, sure, if something like pure energy
17 or any products like that are our premium on
18 existing tariffs, that that's how we go forward, we
19 really don't have an issue.
20
21 I have already spoke out of context about
22 off-peak. It is a matter dear to our hearts. I
23 have really gone through all that --
24
25 THE CHAIRMAN: You can say it again if you wish.
26
27 MR LEES: No-one is going to change their behaviour just
28 for \$17 or \$40, if you're a 9 megawatt customer.
29 That is just one string to our bow. We are
30 installing solar hot water systems at below cost
31 because we're getting the benefits of those. We are
32 in negotiations with the Government with respect to
33 compliance on jurisdictional matters.
34
35 With respect to green, it's tough to get our
36 compliance factored in so that we actually get more
37 benefit from these demand management initiatives.
38 It is very costly to offset our abatement gap. We
39 are looking at new interest loan schemes to shorten
40 the payback on a solar hot water system from five
41 years to less than half that time. That is one of
42 several things but it doesn't help if it doesn't
43 move.
44
45 THE CHAIRMAN: TXU?
46
47 MR EGAN: We have just a couple of points really. First
48 of all, I think we're best off leaving the
49 technicalities of off-peak and shoulder, et cetera,
50 to the locals. Our general thrust would be that
51 choice is best provided through competitive
52 products, through special products that are outside
53 the regulatory umbrella. There is perhaps a minor
54 system's point there. I assume a new regulated
55 tariff would at least be immediately at the target
56 level and therefore immediately cost reflective:
57 that would be good.
58

3/5/02 39

Transcript produced by ComputerReporters

1 THE CHAIRMAN: Thank you very much. Integral?
2
3 MS WALDMAN: On the new regulated target tariffs, I
4 guess what we'd like to see is that you have a basic
5 suite of regulated target tariffs developed and
6 formalised so that it is as simple as possible, as
7 was mentioned earlier. Then you'd look at the scope
8 for the retailer to introduce different products
9 based on a contractual basis and if they want a
10 specific green tariff, then that should be lower
11 market offering rather than a regulated tariff.
12
13 However, there is an argument for a regulated
14 tariff to recover the cost of greenhouse abatement
15 targets; for instance, when these costs go across
16 the entire base rather than those that have just
17 chosen to enter the market. We believe that while
18 it was and it is important to have regulated tariffs
19 to provide customer protection at market start, it
20 should be recognised that over time, and assuming
21 the market developed appropriately, there shouldn't
22 be a need for regulated tariffs in the longer term.
23
24 We would support anything that goes to fewer
25 rather than more regulated tariffs. In what
26 circumstances you should introduce new ones,
27 however, given what we're saying is about a basic
28 suite, we think there does need to be some mechanism
29 whereby there has to be a direct pass-through of any
30 new network tariffs that impact on the regulated
31 tariffs, so retailers don't have to bear the
32 additional risk purely because the network has
33 decided to introduce a new tariff. That wasn't
34 contemplated when regulated tariffs were set.
35
36 In so far as the separate R for shoulder or
37 off-peak, we have stated that a separate variable R
38 factor should be determined for the off-peak 2
39 tariff and it should incorporate the cost of
40 supplying the energy in the shoulder period as well
41 as the off-peak periods.
42
43 We would support anything that allows more
44 appropriate pricing signals, as subtle as they may
45 be, but going in the right direction and from a
46 demand side management and energy efficiency
47 viewpoint it is important for customers in every way
48 possible to understand the cost impacts of using
49 energy actively at times during the day.
50
51 MR WELFARE: My points are basically the last two points
52 just made and that was that if there is a
53 possibility of swinging customers, a better type of
54 usage, more cost reflective - and that is possible -
55 then we would be wholly supportive of that.
56
57 MR KELLY: Our position is that we would like to see no
58 regulated tariffs but, putting that aside, I think

.3/5/02 40

Transcript produced by ComputerReporters

1 one of the points to recognise in regulated tariffs
2 is that customers do have a short span, when talking
3 about innovative products, that should be in the
4 negotiated contract. What a customer does is
5 compare it to the regulated tariff they are
6 currently on, so the control and constraints and the
7 way that those regulated tariffs are changed does
8 have an impact into the negotiated contract market.
9
10 Another aspect that probably needs to be
11 considered is if you do introduce new regulated
12 tariffs, what is the option for the customer? Is
13 that imposed on the customer or does the customer
14 have a choice of moving to that new regulated
15 tariff?
16
17 MR COX: Further comments?
18
19 MS TRISH BENSON: I think I may have given the
20 impression we do not support EnergyAustralia's
21 demand management strategies. We do.
22
23 MR COX: I get the impression that most people have a
24 view that there should not be new regulated tariffs
25 or only in very exceptional circumstances; is that
26 correct? Does anybody strongly disagree with that?
27
28 MS TERRI BENSON: We think that there should be the
29 ability to but there should be a framework for it to
30 happen. I am not saying there should be a blanket
31 rule you can't do it. If it is appropriate for
32 transition tariffs or to match network change or to
33 cope with demand management issues not thought of,
34 there needs to be a framework.
35
36 MR COX: The presumption should be no, but there might
37 be exceptions; is that right?
38
39 MR WELLSMORE: If I can just comment, the current
40 determination has two years left to run. At best if
41 somebody comes out in the next 12 months with a
42 fantastic idea that everybody thinks is the way to
43 go, yes. We are not that far off anyway.
44
45 MS WALDMAN: What we said is, you can't write it off
46 completely, that there should be some mechanism if
47 something unforeseen happens.
48
49 MR COX: Something unusual, it could happen, there would
50 have to be a strong case?
51
52 MS WALDMAN: Yes.
53
54 MS TRISH BENSON: Reasonable.
55
56 MS TRISH BENSON: That will bring out the lawyers.
57
58 MR COX: Yes, "reasonable" is a difficult word. I am

.3/5/02 41

Transcript produced by ComputerReporters

1 not sure where we ended up on the peak shoulder
2 issue. My impression is that most people are not
3 strongly supportive of a separate shoulder component
4 but there should be consideration of the off-peak
5 costs is where we came out.
6
7 MR LEES: We are very strong on what we consider, what
8 we call the off-peak 1 and off-peak 2 because of the
9 cost components. We don't think there is anything
10 wrong with having as many targets as you have major
11 towns. We have 95 per cent of our customers on four
12 tariffs. We don't think four targets is
13 unreasonable for that. We don't have the issues of
14 Country Energy, but certainly the cost make-up is
15 different.
16
17 MS BANICEVIC: At the moment we have a significant
18 number of targets. Even if we fix up the problems
19 with the tariffs, we will still have a number of
20 tariffs.
21
22 MS TERRI BENSON: There is the control load R. At the
23 moment the control load is supplied, not all of our
24 technically controlled load tariffs are off-peak 1.
25 The way the control load R is constructed to be
26 off-peak 1 only does not apply to our controlled
27 load tariffs.
28
29 MR COX: So it is a miss-match between reality and what
30 is in the R?
31
32 MS TERRI BENSON: Yes.
33
34 MR COX: Any comments from people at the back?
35
36 PROF PARRY: Should there be regulated tariffs? I
37 remind people that New South Wales is now compliant
38 with the National Electricity Law and the
39 Electricity Code. As a jurisdictional regulator we
40 don't under the code regulate retail tariffs. Our
41 role has been given to us by the Minister, who asked
42 us to set for the period 2004 default tariffs, which
43 we have done, and he has asked us to review those
44 tariffs, which we are now doing.
45
46 I don't believe, even if it was argued, that it
47 is open to us to set a category of any other tariff
48 that DNSP or a retailer might think is appropriate
49 at somepoint in time. I don't think that is
50 possible. If there is a change in circumstances, I
51 pick up Jim Wellsmore's point about we have only got
52 two years to go anyway, so if there are certain
53 circumstances that arise presumably it is open to
54 the Minister to refer to us the question of whether
55 there should be some other category or specific type
56 of regulated default tariff which he is presumably
57 able to set. I don't think it is open for us to do
58 anything to give us flexibility because I don't

.3/5/02 42

Transcript produced by ComputerReporters

1 think the power is there - subject, of course, to
2 legal advice as always, the standing caveat.
3
4 MR NICK SAPHIN: Does that cover an old tariff
5 introduced last year?
6
7 PROF PARRY: I don't know the answer to that, but I keep
8 on being told, maybe Michael remembers what the
9 advice is, that some of the sorts of things that EA
10 raised I think they told me could have been
11 accommodated in a way like that, but maybe Michael
12 has the answer.
13
14 The question was, is it possible to resurrect
15 or reintroduce or bring back to life a tariff that
16 is extinguished in some form and use that under the
17 current regulative arrangements, because I know
18 there has been a conversation between the EA and us
19 on some of the specifics and I can't remember where
20 that ended up in terms of what mechanisms. Michael,
21 you don't know the answer?
22
23 MR SEERY: No.
24
25 MR COX: The answer may not be easy. That does tend to
26 reinforce the point that new tariffs are difficult.
27
28 MR SAPHIN: I think we are trying to have too many
29 different ways here. I know it is a balancing act
30 but IPART did a report on demand management this
31 week for retail and there are things in there about
32 smart metering and doing things with the customers,
33 and at the same time we are talking here about
34 issues as to whether tariffs are cost reflective and
35 monitor what the market prices are. Unless we
36 actually address the first one, you will never get
37 the second one to drive changes in behaviour.
38
39 I know it is difficult to balance the two out
40 but if we don't address the first one in terms of
41 making the tariffs cost reflective in terms of what
42 the market costs are, this would not be open to
43 negotiation. If you close off completely new
44 tariffs for those customers, you will never get any
45 change in behaviour if you are trying to address the
46 demand management issues in the discussion paper.
47
48 MR COX: I sympathise with your comments. Anything else
49 anybody else wants to add at this stage? If not, we
50 will close off the session now. Thank you very much
51 for your comments. I believe the next stage is that
52 we are willing to consider further submissions on
53 the issues arising from today up to 10 May, so we
54 would obviously like to hear from you if you have
55 more to add. Thank you very much for your
56 attendance and your contribution.
