Submission: Such a poorly thought out and implemented scheme which makes it near impossible for some consumers to redeem their deposit. Prices certainly did rise almost universally to the 15 cents odd including GST levied on suppliers. This scheme is so inefficient when compared to our home kerbside recycling bins but if we use this efficient method we lose our container deposit. To get your deposit back via an RVM almost always costs more in fuel than the redeemable value of the containers and that does not take into account the value of your time. Inefficiency is there with the RVMs too in that they do not compact their contents and as such fill very quickly. The garbage trucks servicing these RVMs do compact the containers and as such they are spending a lot of time and fuel traveling between sites while themselves half empty capacity wise. The whole scheme is so inefficient and seems to be a negative on the environment with all the pollution created by all this unnecessary travel just to redeem a deposit. In contrast the home kerbside recycling is massively more efficient.
