Submission: Quite frankly it takes government to stuff up what was previously an excellent system whereby I as an ASP was able to arrange installation and connection as required by builders, solar installers general customers etc. Now I install and connect power to service fuses and the electricity supplier eventually arranges someone to turn up and install a meter. In most cases meter installations from my observations occur within 10 to 30 days with the customer having very little information or being supplied with an unrealistic time and date that doesn't eventuate. I also have the concern regarding who tests the operation and safety of the new installation (mainly confined to the main switchboard).
