Submission: We are a residential construction company undertaking works across the Sydney Metro area. There appears to be no consistency between the connections requirements for new homes, between the various suppliers. When we contact our mains electrical contractor in order to disconnect power for demolition and re-connect for a temporary builder's service, the requirements vary subject to the electrical provider for the area. This makes it difficult to advise our clients with relation to their accounts. During construction, the new system dictates that the builder is advised when the meterbox connection can occur. Previously, based on the construction timetable, the builder had the opportunity to nominate a date for installation and connection. There is a little flexibility in the connection of services.
