SOLAR FEED-IN TARIFFS 2017/18

Friday, 19 May 2017

1:16:14 PM

It was the introduction of the 60c rebate that encouraged us to be early adopters of rooftop solar back in 2008. Now to find that despite the rising cost of electricity we only get around 6c/kWh does smack of highway robbery.

The recent introduction of batteries powered by rooftop solar will be a game changer and a significant disrupter in the electricity market. Hence as electricity wholesalers we should be getting a price that better reflects that market and it should be incumbent on the government to:

- * ensure retailers are obligated to pay the minimum feed-in-tariff
- * that they pay a fair and equitable price for rooftop solar in line with the wholesale electricity market.
