SOLAR FEED-IN TARIFFS 2017/18

Friday, 19 May 2017

Obviously, after connecting solar power last year to help reduce my power bills and also decrease pollutants in the atmosphere, I support an increase in the feed-in tariff. Eventually I would like to purchase batteries to further reduce my power bills.

Feed -in tariffs should be increased in line with electricity price increases to further reduce prices for those people who have converted to solar.

I have had solar hot water for over 10 years and have recently converted to solar power. All experiences have been beneficial for my family.

I believe that the government should make solar power affordable for all households and businesses, especially in country areas, as it would help improve the environment and health of people, with less pollutants in the atmosphere.
