Submission: I am very strongly opposed to any changes to Solo Water's licence that would allow it to discharge any liquid waste into the environment from their site at all. Any discharged effluent would be extremely detrimental to the local land and marine environments as well as hazardous to the local and visiting publics' health. There are other viable alternatives that would not harm the local environment or public health and would provide a better longer term solution. Now that Solo Water are not able to cope with the volumes of waste they should be required to connect to the existing waste water system. Or, new development could be halted so that Solo Water's current license allowance can be adhered to and managed effectively.
