Submission: I do not understand how IPART can possibly consider a feed in tariff of 9 cents per KWh when the retail price is 27.09 cent per KWh. As for costing the electricity producers more to process solar why do I pay a Supply Charge of 82.89 cents per DAY? On top of that retailers charge an additional premium for Green Energy. Why did governments, both Federal and State, put so much into encouraging citizens to put solar on their roofs? This proposal by IPART is just another way for Big Business to appease their share holders and to hell with the citizens who are doing their best to help the environment and hopefully have an impact on the current increase in global temperature
