Submission: Like all producers of electricity, we have made an investment in an energy-producing asset and we should expect a fair and reasonable return, certainly no less than the big electricity-generators get. In addition, we are contributing to a distributed-network electricity supply which, with appropriate regulation and technology investment results in a much more stable electricity supply than the point-source big-generator model that Australia has and the world is moving away from. It's clear that solar is successful as solar has already bought down the price of electricity (hence the proposal to reduce the fee-in tariff) and we who have made this investment and commitment should not be punished by reducing the FIT. Distributed renewable-generation and supply is the obvious way to go to ensure a stable and low-cost electricity supply into the future and you should not be dissuading people from making these investments by cutting the FIT, and thereby their returns on investment. We are all voters and we know that this is the way to go to provide environmentally-effective and 'cheap' power as once the externalities of coal etc generation are included in the cost of that power, the true costs over time to the country and its population are huge. Solar power almost totally eliminates those externalities and individual citizens who take on that burden of providing clean power should be applauded and rewarded.
