Submission: With coal powered power plants shutting down and the increasing threat of prolonged power outages wouldn't it be smart thinking to encourage people to instal solar panels and feed their excess power back to the grid. A fair price for the power we solar citizens export back to the grid would be a incentive at a time when we're all struggling to pay our exhorbitant power bills. Receiving little or nothing for power exported back to the grid is a rip off which will continue unless the FIT is regulated and mandated so that retailers are forced to pay a fair price for the power we export to the grid.
