Submission: The feed-in tariff should in fact be INCREASED, not decreased as solar generated electricity becomes the norm. As a result the price paid to home generators should reflect more closely the cost electricity is on-sold to consumers. After all we have all paid for that gold-plating the infrastructure in the past - the very reason we were told prices had to go up so much in the past!! Any reduction reflects poorly on the commission as it will be seen to support commercial interests above residents in this State of NSW.
