Submission: "My wife and I live in the [REDACTED] and have recently installed a rooftop solar system. We and nearly 2 million others are therefore contributing to the environmental and health benefits of ourselves and the community by not requiring as much dirty coal fired power generation for which the [REDACTED] is infamous. We have also contributed excess power generation to the grid during times of extreme hot weather, helping to offset peak demand and the possibility of power outages.

With these contributions to the national grid and the community benefits of better environmental and health outcomes it is surely time to mandate, to guarantee a fair and reasonable price for renewable power fed to the grid."
