Submission: Our house is a power generator. With only two of us in the house, for the most part with only a refrigerator turned on, we have constantly produced more electricity than we can possibly use. Previously this meant fair payment for our product by the electricity company looking to take advantage of it. Now we find ourselves paying the same amount each quarter for that one refrigerator, a light or two and a TV after 6pm, and an occasional computer, as we did before we installed solar power and the kids left home. This is totally biased against those who have done the right things to save themselves money and hardship, and who are actually assisting the Federal government to meet Australia's emissions reduction targets. We need - and deserve - immediate strong support from our governments at both State and Federal levels. Otherwise we, the power producers, will stop supporting the government and make that switch to safe battery storage for our most valuable asset - sunlight.
