Submission: The north coast of NSW has the highest rainfall in the state and the highest entitlement charge of all the listed areas covered by NSW Water. The area possibly has the lowest input cost and infrastructure to the rate payers. Your stream flow monitor on Gum Creek lay on its side for a few years, this has been the only visible input other than the licence control, glossy publications and website showing all the wonder things that are being done in other areas. There are no dams, aquaducts, irrigation channels or structures that NSW Water provide for us. Only tax grabs. If this charge only covers part of the cost of NSW Water management services then the money must be being spent in other areas or the service is inefficient. Where is the service? We all continue to pay this levy as it is the only way to keep our water licence, maintain water security and the value of our properties even if most don't use their entitlement of water.
