Submission: "Solar is the way of the future to contribute to our power supply. A large number of Australians have installed solar which includes feed in to the grid. We are one of those families who have invested in solar where excess feeds back into the grid. This is a valuable resource with community members using their own resources to benefit the environment and provide power. To reduce the tariff is totally unreasonable as it is essential that people are encouraged to participate in the provision of power. I ask that you not not reduce the feed in tariff.
