**SOLAR FEED-IN TARIFFS 2017/18**

**Friday, 19 May 2017**  
11:41:48 AM

I think that the price should reflect the value in keeping grid stability during heatwaves and the potential benefit of DER in allowing frequency stabilisation etc in the future. I think it's outrageous that companies can charge 45c+ but give me only 6c for my clean energy. The price must also include the social cost of carbon, how can we in 2017 ignore this? It's criminal to pretend that electrons from coal or gas generation are the same as solar electrons. We must acknowledge this with a fair price for solar generation for homeowners.
