Submission: Home solar owners already pay energy retailers a fee for a daily network connection. Why should solar home owners also subsidise electricity generators and distributors for the electricity that they produce, but receive a pittance for whatever energy we supply to the grid. It is wholly unfair. It will only drive more solar home owners to uptake solar batteries and eventually ditch network supplied electricity. The moment solar batteries become a compelling option, I will upgrade my solar array and install batteries. I look forward to cutting my power line, saving the daily connection ripoff and the kWh supply ripoff. Ausgrid and friends can get STUFFED.
