Submission: Solar feed in tariffs need to be calculated as a percentage of the rate charged by the electricity provider when they sell the product.

Additionally, owners of solar systems must be able to cover the cost of purchase, within an acceptable time frame taking into account the life expectancy of the panels & associated equipment, cover the cost of ongoing maintenance as well as having the ability to reduce their overall energy costs.

Without these costs being adequately covered, by the feed in tariff, solar will be sure to fail.
