Submission: I believe the proportion of water cost per consumption to the total of the water bill is too low and the proportion of services fee is too high. From water saving point of view, the services fees should be largely move to consumption charge, therefore the more you use, the more you pay. Current price structure is subsidizing people who consume more water for a lifestyle, e.g. swimming pool etc. Research need to be done on per household per person typical reasonable water consumption, depends on numbers of regular residents in the household, there is essential need water price. Then above it, there are few prices for the consumptions above the essential need threshold per person. Current services fee should move into consumption charge(at least most of it). This way to encourage water preservation.
