Submission: I find it hard to believe that people feeding in renewable electricity, such as solar, to the grid are getting a fair price.

My reasons are as follows.

1. The energy companies do not have any associated costs to produce the electricity that is fed into the grid.
2. The energy companies can and do charge more to their customers if they choose to buy renewable energy.
3. Energy companies get credits for supplying renewable energy. Buying coal power is more heavily taxed.

Furthermore I would like to know how much energy companies pay for energy which comes from a coal plant?

I want to put more solar on my house because it is good for the environment, however I am totally turned off because I do not believe I am going to get a fair price for the energy I put back into the grid. Time to look into a battery backup system.
