Submission: Dear NSW IPART

I have just stumbled across the fact that there is a review of the NSW Feed in Tariff.

Surely all Solar Power Households could be informed of this fact by their power company or the government who obviously knows who has solar.

I believe the solar export payment should be at least \$0.20/KW/h similar to what the electrical costs me. My feed in electricity goes to my neighbors in my street it therefore saves the power companies supply cost. My solar power is produced mostly when the spot-price is higher, and due to less losses from transmission distance. I have 15 neighbors within 50m of my property

If you make the feed in tariff less than a reasonable amount, people like me will go off grid, Tesla and other battery systems that are on the horizon will become more affordable, efficient and easy to install, especially if you have a solar PV system with another 20 years life

Households with solar PV will jump at the chance to go off grid and be as self sufficient as possible.

This will definitely result in a "death spiral" in power usage and financial returns for the power companies

Most people are sick of being treated like mugs by the power companies, who have gold plated the network using our hard earned \$\$\$, then for the Gold Plated Poles and Wires to be sold off with no reimbursement to us the the citizens who paid for it.

Kind Regards

Mark Hessen
