Submission: At present my feed-in tariff with AGL is 8c per unit. The wholesaler for the Bathurst area is Essential Energy. Unless I misread information on their website their wholesale price is around 15c per unit. The electrons that my system put into the grid are the same as those electrons fed into the grid at Mt Piper power station, the nearest generator to me. Why aren't I getting the same feed-in tariff?

When the overly generous 60c, 40c & 20c feed-in tariff contracts come to an end, why shouldn't all household solar generators receive the same feed-in tariffs at the same rate that the power station generators charge their retailers ie the wholesale rate?
