

INDEPENDENT PRICING AND REGULATORY TRIBUNAL

PUBLIC CONSULTATION MEETING INTO REVIEW OF GAS ACCESS  
ARRANGEMENTS - AGLGN

---

Tribunal Members

Mr James Cox - Acting Chairman  
Ms Cristina Cifuentes- Part-time Member

---

Held at the Marra Room, Level 2  
Grace Hotel, 77 York Street, Sydney NSW 2000

On Wednesday, 15 September 2004, at 2pm

---

.15/9/004            1    GAS ACCESS - AGLGN  
Transcript produced by ComputerReporters

---

1 MR COX: Good afternoon, ladies and gentlemen, and  
welcome.

2 My name is Jim Cox and I am Acting Chairman of the  
3 Independent Pricing and Regulatory Tribunal. With me is my  
4 colleague Cristina Cifuentes and a number of members of the  
5 tribunal secretariat.

6  
7 The purpose of today's forum is for us to hear and to  
8 take into account the views of interested parties on three  
9 key issues relating to the review of AGLGN's proposed  
10 revisions to its access arrangement. These issues are:  
11 the total cost review, proposed trunk zone merger, and  
12 terms and conditions.

13  
14 As you will be aware, the tribunal has engaged several  
15 consultants to work on these issues. The Energy Consulting  
16 Group has undertaken a review of the capital and  
17 non-capital cost of AGL's access arrangement submission.  
18 The Allen Consulting Group has carried out a review of  
19 terms and conditions and, in addition, the tribunal  
20 secretariat has undertaken some analysis of the proposed  
21 merger of AGL trunk zones.

22  
23 Today's meeting gives you the chance to have your say  
24 on those issues and will also enable the tribunal to have  
25 the benefit of your views as we form views on these  
26 difficult issues.

27  
28 I should emphasise that to date the tribunal has made  
29 no decisions on whether to accept in full or in part either  
30 or any of the consultants' findings or recommendations; nor  
31 have we formed any view on the zone merger. For that  
32 reason your views are very important as they will inform  
33 and assist the tribunal in making decisions on these  
34 matters.

35  
36 I should emphasise that in addition to the forum  
37 today, we will accept written submissions on these and any  
38 other matters up to Wednesday, 6 October 2004. That's a  
39 later date than the 29 September date currently on the web  
40 site.

41  
42 We will run this forum by having a number of brief  
43 presentations followed up by roundtable discussion from  
44 people sitting at the table here. Then, if there is time,  
45 we will take comments and questions from people sitting at  
46 the back of the room. There are three main items to be  
47 discussed and we will have a short break after the second

1 session.

2  
3 I should emphasise that the discussion will be  
4 transcribed for the benefit of the tribunal and the  
5 secretariat so that we have a record of what is said at the  
6 meeting. It would be useful if you could introduce  
7 yourselves for the benefit of the transcribers when you  
8 start to speak, and also try and speak slowly and clearly,  
9 as I am endeavouring to do now.

10  
11 Before I move on to presentations I will pass over to  
12 Ruth Lavery, who will talk just briefly about the review  
13 process and the timetable.

14  
15 MS LAVERY: As Jim mentioned, the web site at the moment  
16 says that public submissions are due by 29 September. We  
17 have extended that for another week; it is now Wednesday, 6  
18 October. We are looking at this stage for the new access  
19 arrangement to commence on 1 April next year, not 1  
20 January. We are not going to meet that deadline.

21  
22 We are planning on putting out a draft decision during  
23 November. We will be looking for AGL's response and  
24 holding more public forums in January, at this stage, with  
25 a view to putting out a final decision in February next  
26 year to meet that 1 April start time. The web site will be  
27 updated to show that, probably this afternoon or tomorrow.

28  
29 TOTAL COST REVIEW

30  
31 MR COX: The first presentation will be made by Ed Teoh,  
32 who is a director of the Energy Consulting Group. He will  
33 talk about the total cost review.

34  
35 I have done a very cruel thing to Ed by not allowing  
36 him to use his slides, so he is just going to speak to us.  
37 Given the fairly crowded nature of this room, I think it  
38 will probably work a bit better. He has promised me he  
39 will keep to 20 minutes and when he has finished, we will  
40 follow up with a roundtable discussion on the issues he has  
41 raised.

42  
43 MR TEOH: Thank you. With me is Malcolm Young. He  
44 is  
45 also a director of Energy Consulting Group. During the  
46 discussions, if I cannot answer any questions, Malcolm  
47 certainly will be able to assist in that area.

1 As you are aware, the report has been out for a while  
2 now, so in terms of its specific details, please refer to  
3 the report itself. I will just go through basically what  
4 we have done and some of the thoughts that we went through  
5 in making the decisions and reaching the conclusions that  
6 we came to.

8 As you are aware, what we have done is basically a  
9 total cost study. In terms of this process, what is very  
10 important to us is the gas code itself. In terms of how we  
11 have applied it, I think it is very important for you to  
12 understand the way that we have looked at it. The network,  
13 as we see it, is a long-term asset. Whilst we are looking  
14 at a review over a five-year period, we have considered it  
15 in a perspective of how the assets would operate over the  
16 long-term period?

18 We have also looked at things in terms of the business  
19 processes itself - how is cost controlled within the  
20 business to ensure that there are sufficient cost controls,  
21 and if there is an optimum balance between the capital  
22 expenditure and the non-capital expenditure.

24 We have also given consideration to the safety aspect  
25 and the integrity of the networks, which we believe is very  
26 important aspect of operating the network. In terms of how  
27 we have applied it, we have considered what is reasonable  
28 and good industry practice.

30 We went through a series of questions and answers  
31 with the gas networks. I suppose from that perspective, we  
32 had enormous cooperation in the providing of data. We also  
33 met up with a few stakeholders - Orica and EnergyAustralia  
34 and others. We considered a number of documents including  
35 the asset management plan, the safety and operating plans,  
36 marketing strategies and business plans, and various  
37 project justifications.

39 If you look at the gas networks, our view is that the  
40 AGL gas networks is in a pretty good condition. The  
41 primary mains, which are steel mains, are cathodically  
42 protected. That gives them, I suppose, a good assurance  
43 that the assets will last their economic life. 95 per cent  
44 of the low pressure and medium pressure system has already  
45 been renewed, which means in terms of the work moving  
46 forward it has to be justified on economic grounds itself.  
47

1 With regard to the other ancillary assets - the  
2 regulating stations, the meters - our view is that  
3 primarily they are in very good condition. There are some  
4 issues with regulating stations and spare parts, but that  
5 is not isolated to AGL alone. Residential meters are  
6 currently within a field life extension program. To me  
7 that is very much current practice with other utilities as  
8 well.

10 In terms of the capital expenditure for 2000-2004, we  
11 have looked at it from a perspective to see where they  
12 underspent and where overspending has occurred and the  
13 reasons for those occurrences. If you look at it in terms  
14 of the expansion capital, there is about \$45m above what  
15 has been approved for the access arrangement. In the other  
16 areas - system related and non-system - there has been  
17 underspending.

19 When we looked at the expansion capital, we considered  
20 it from the perspective of the unit cost itself: What is  
21 the cost of laying mains? What is the cost of laying the  
22 services and what is the cost of installing meters? What  
23 we have come up with essentially is that in terms of the  
24 service costs and the meter costs that AGL has incurred  
25 over this current period, we believe they are consistent  
26 with what we would consider efficient.

28 Turning to the mains cost, what has been submitted is  
29 based on what I would call a building block approach, which  
30 is essentially a contractor's costs plus overhead costs.  
31 Factored into that would be the mix of customers that those  
32 mains are laid for.

34 In one particular category, we believe that the unit  
35 cost itself is a little bit higher than what we would  
36 consider sufficient from an industry perspective. As a  
37 result of that, we have adjusted our recommended capital  
38 expenditure from the \$252m that has been submitted down to  
39 about \$249m. So there is a minor adjustment in a  
40 particular mains category because we considered that the  
41 cost was a little bit high.

43 Moving on to the renew/replacement category and the  
44 reinforcement category, we looked at what AGL has incurred  
45 over the current period. Essentially the expenditure is  
46 48 per cent less than what was actually approved. The  
47 reasons is that there has been a deferral of the primary

1 mains loop project and there has been a reduction of the  
2 meter replacement program as a result of the field life  
3 extension. We looked at the reinforcement program on a  
4 project-by-project basis and what we have come up with is  
5 that the reinforcement program is reasonable, the cost is  
6 reasonable, the mains and rehabilitation and also the meter  
7 replacement program have substantially been reduced. From  
8 that perspective, when we looked at how it has actually  
9 been applied, we considered that that has been reasonable  
10 as well. So we are recommending the expenditure that has  
11 been submitted in the access arrangement.

12  
13 The non-system assets is an interesting issue. Some  
14 \$21.3m was submitted in that category. Out of that, there  
15 was about \$7.5m of motor vehicles cost and about \$5.3m of  
16 IT costs. With regard to the motor vehicles' costs we  
17 looked at the motor vehicle policy that AGL Gas Networks  
18 supplies - how they have considered it on a cyclic nature?  
19 What do they do as far as trucks are concerned? - and we  
20 looked at the unit cost of the vehicles. We believe that  
21 the cost they have submitted is reasonable itself and we  
22 are recommending that expenditure.

23  
24 In terms of the IT costs, it is mainly related to the  
25 FRC cost itself and the reconciliation of FRC costs for  
26 this current period. Whilst there has been a separate  
27 exercise to review the FRC costs, when we did the final  
28 reconciliation we accepted it on the basis that it falls  
29 within what was that separate exercise. So we are  
30 recommending that expenditure.

31  
32 During this exercise, AGL did advise us that they  
33 inadvertently left out corporate IT costs, and that was a  
34 total of about \$24.9m being submitted as part of that. We  
35 looked at it from a project-by-project basis and what was  
36 the business case and justification for that \$24.9m?  
37 Although it is a separate exercise from what has been  
38 considered here, I thought I should mention that when we  
39 looked at it, we thought that the cost was reasonable.

40  
41 Moving forward to the current period or the forecast  
42 period, certainly the expenditure level is much, much  
43 higher than the actual expenditure for the past period  
44 itself. When we looked at that, there was good  
45 justification for some projects and we have, I suppose,  
46 applied our judgment on others as well.

47

1 I will start off by talking about the market expansion  
2 category. As I mentioned, we looked at it from the unit  
3 cost perspective - mains, services and meters. In the case  
4 of mains, we have applied the same rule as we did for our  
5 review in the current period itself. Where we have come up  
6 with the one particular category of laying mains as being  
7 higher, it is the same in this area. The way we have  
8 applied it is, although we realise that AGL does use a lot  
9 of contractors, it is the application of the cost itself  
10 being carried through to forming an estimate for unit  
11 costs. Looking at those sorts of estimates and comparing  
12 those, we believe that particular category which is for new  
13 homes in established areas is higher than what we would  
14 consider reasonable.

15  
16 As to services, we concur with the estimates that AGL  
17 have put together. In terms of residential meters, I  
18 suppose, there are different categories of residential  
19 meters. There are what I will call small, medium and large  
20 sized meters. Because of the mix of meters, the unit cost  
21 is a weighted average cost of those three particular  
22 categories.

23  
24 We believe that the industry today is moving in terms  
25 of the medium-sized meter to a lower cost option. The  
26 reason for that is the introduction of instantaneous hot  
27 water services, which is increasing the medium-sized meters  
28 more so than, I suppose, was the case a few years ago.  
29 What we are seeing in other utilities is the introduction  
30 of a cheaper meter option that would then sort of fill that  
31 gap as compared with what is actually being applied in AGL  
32 at the moment.

33  
34 In discussions with AGL, we have been advised that  
35 certainly they are trialling the meters at the moment.  
36 They have not found a suitable option. However, we believe  
37 that if you look at other jurisdictions, other utilities,  
38 they are already being used and that should be factored  
39 into the estimates for the next period itself. So our  
40 recommended expenditure is a little bit lower than AGL came  
41 up with.

42  
43 In terms of the other categories, which is the  
44 industrial and commercial meters and costs of laying mains  
45 and services for those areas, in our review we have looked  
46 at how they have applied it, and we agree with their  
47 numbers.

1  
2 Just in broad numbers, in terms of the forecast to our  
3 recommended expenditure, in five years AGL are saying the  
4 total expenditure will be about \$272m. We are recommending  
5 in the order of \$256m.

6  
7 Moving on to system reinforcement, there are over 70  
8 projects proposed in this area. Obviously we cannot look  
9 at all of them, but we have looked at material projects,  
10 the ones essentially over \$1m. We have looked at two  
11 project in particular - one is the Wollongong secondary  
12 mains project and the other is the Narellan medium pressure  
13 reinforcement. With those two projects in particular, we  
14 believe, there are opportunities to reduce the costs.

15  
16 In the case of the Wollongong secondary mains, the  
17 information that has been provided to us shows a couple of  
18 options. The option that we are recommending is staging  
19 the cost over a period rather than doing it over this  
20 current period. Doing that gives AGL the opportunity of  
21 looking at the growth and whether it warrants doing a  
22 complete project versus doing it over the current period,  
23 which is then spending the total full amount over this  
24 period.

25  
26 In terms of the Narellan project, we believe, given  
27 the data available to us, that it can be deferred to the  
28 next access arrangement period.

29  
30 The other aspect in looking at this expenditure is  
31 that we quite often look at reinforcements that have been  
32 put forward as compared with what has actually occurred.  
33 The reason for that is, in terms of demands and customers  
34 numbers, the expenditure that is usually incurred over the  
35 period is always slightly less than what has actually been  
36 forecast. That is because with the forecast data, not only  
37 talking about growth and customer numbers and demand but  
38 also in systems procedure, generally at a point in time you  
39 will find that there is an opportunity to defer them, move  
40 them forward, because the loads that are supposed to occur  
41 have not actually occurred. We believe, given that  
42 situation, there is an opportunity of a 10 per cent  
43 reduction in expenditure.

44  
45 Moving on to renewal and replacement, the program we  
46 have at this stage is what I spoke about earlier. About 5  
47 per cent of the low pressure medium pressure network has

1 not been renewed. Our view is that, under those  
2 circumstances, there should be a clear asset management  
3 plan developed to look at rolling out or renewing that 5  
4 per cent. That should be done on the basis of economic  
5 grounds and on safety and reliability.

6  
7 What we saw to date in terms of the information that  
8 is available to us says that it certainly justifies some  
9 work to be done, but not to the extent of having the 5 per  
10 cent renewed over this period. We believe that an asset  
11 management plan will put out this expenditure maybe in the  
12 order of a five to a ten-year period. So we recommend  
13 about half the expenditure of what has been submitted on  
14 that basis. At the same time with AGL, and us as well,  
15 there is extra data to be gathered which will also indicate  
16 the appropriate time for the replacement of the remainder  
17 of the 5 per cent.

18  
19 In terms of the meter replacement, we have certainly  
20 looked at it to see what are the initiatives that AGL is  
21 putting in. In two particular areas, which are the  
22 domestic regulator replacement areas and the industrial  
23 regulator replacement areas, we believe there are  
24 opportunities for a cost reduction or lessening of the  
25 workload itself. This is mainly because current industry  
26 practice is that you do not replace an industrial regulator  
27 on a meter change. You do it on a needs basis. In some  
28 cases, we acknowledge that it has to be done, but not all  
29 the cases. So we have allowed some expenditure for that  
30 category, but not all of it.

31  
32 The same applies for domestic regulators: it is done  
33 at a time when the meters are changed due to, I suppose,  
34 expiry of their life in the field. In discussions with AGL  
35 they moved from total replacement to a targeted replacement  
36 and we have agreed on that approach itself. So there has  
37 been a slight cost reduction as a result of further  
38 discussions with AGL.

39  
40 Turning to the Sydney primary loop project, the cost  
41 has actually increased significantly from about \$36m to  
42 \$51m. We have looked at it on two bases: is there  
43 justification for the cost itself and is there a need for  
44 that particular project? In the information that has been  
45 provided to us as to the difficulty about conducting in  
46 that area - there is an extension of three kilometres of  
47 pipeline, there is extra reinstatement of conditions

1 required - it justifies the increase in cost. Even if it  
2 justified the increase in costs the quandary that we went  
3 through was: the project has been put forward as a risk  
4 mitigation project to increase the security of supply  
5 through to Sydney itself, and is that mitigation justified?  
6

7 If you look at Victoria and in particular what  
8 happened during the Longford incident and after that, there  
9 was \$200m spent on building underground storage to increase  
10 the security of supply to Melbourne itself. On top of  
11 that, if you look at the Victorian system, there is a  
12 duplication of the Victorian system that should one of the  
13 mains be hit by a construction contractor, or something  
14 like that, at least not all of Melbourne will lose the  
15 supply. Based on the numbers that we have worked through,  
16 we believe there is sufficient justification for  
17 recommending that the primary loop project go ahead in the  
18 current periods.  
19

20 Moving onto the non system capex areas, I suppose the  
21 two main areas, one is in the IT and the other one is in  
22 vehicles. We believe that in terms of vehicles, looking at  
23 the number of vehicles required, there is no justification  
24 for increased costs as was submitted in this current  
25 period, that the numbers of vehicles is realised on a  
26 cyclical nature, that what is being replaced in the  
27 previous period should be about the same number as  
28 currently. We recommend the same level of expenditure, not  
29 an increase.  
30

31 In terms of IT costs, there was over \$37m submitted in  
32 that area. We have looked at the IT, what proposals have  
33 come through, business cases that either have been  
34 developed or considered at this point of time, and what are  
35 I suppose what I would consider on the "wish list" itself.  
36 We believe that there is sufficient justification for some  
37 of the projects, not all of them at this point of time, and  
38 there is also a need to ensure that whilst we go through  
39 the five-year period there are sufficient, I suppose,  
40 moneys in there for ad hoc changes and enhancements in  
41 those systems. What we are recommending is an expenditure  
42 of \$30m instead of the \$37m that has been submitted.  
43

44 Given that situation, what we have come up with is in  
45 the five-year period there is a total expenditure of about  
46 \$560m. We are recommending in the order of about \$500m.  
47

1 Moving on to non capital cost, I suppose the approach  
2 we have taken is to look at the costs of 2004 as the line  
3 in the sand before we looked at what is proposed for the  
4 current period. The reason why we have done that is in  
5 terms of benchmarking there is really high level  
6 benchmarking to be done and that is indicating to us that,  
7 although AGL's costs are at a reasonable level compared to  
8 other utilities, our concern is how is it in comparison to  
9 what the operating conditions are in New South Wales.  
10

11 In looking at this current period, we believe that  
12 given the customer growth and the demand that is above what  
13 was initially forecast, the operations and maintenance  
14 costs, and the overheads costs as an aggregate, are  
15 considered reasonable. In further discussions with AGL,  
16 there is a reduction in insurance costs and that has been  
17 factored into the overheads component itself.  
18

19 Marketing expenditure is one that we have had a very  
20 close look at and I suppose we are very aware of the  
21 penetration in the New South Wales market as compared to  
22 the Victorian and ACT markets, which are I suppose of a  
23 colder climate. In terms of where the AGL expenditure is  
24 today, we believe that most of it is in incentives to  
25 builders and that it is currently about at the right level.  
26

27 Whilst we looked at the forecast expenditure for this  
28 next period, I suppose AGL's expenditure for the operating  
29 and maintenance period we have looked at from a perspective  
30 that, if they are at that level, can the networks be  
31 operated efficiently and, despite the fact that we are not  
32 recommending a full replacement, is that level of  
33 expenditure sufficient. In our view, given that it is a  
34 long-term asset, and deterioration of the assets does not  
35 occur rapidly, we believe there is sufficient I suppose  
36 expenditure in the operations and maintenance to cover that  
37 area. We are recommending the operations and maintenance  
38 expenditure as has been submitted.  
39

40 In terms of the efficiency improvement, AGL submitted  
41 about 1.5 per cent efficiency improvement instead of 3 per  
42 cent for the current period. We have looked at it from a  
43 utilities throughout Australia perspective as to what has  
44 been the efficiency improvement experience in those areas  
45 and also what has been put in as far as different access  
46 arrangements are concerned, and we believe that about 1.5  
47 per cent is a reasonable level to be achieving over the

1 next period.  
2  
3  
4 AGL also has put in another incentive in terms of  
5 their marketing area as a \$3m business case for I suppose  
6 targeting the hot water market itself. What we did was we  
7 had a considerable discussion with them as to who they are  
8 targeting, which part of the market they are targeting and  
9 what their plans are moving forward. In looking at their  
10 costs aspects in terms of justifying the whole process, we  
11 concur with them that this initiative should be  
12 recommended.  
13  
14 In terms of, the last one, forecasts, AGL has put in  
15 2.2 per cent for unaccounted for gas. We believe that,  
16 given the changes in demand, there is probably  
17 justification for 2.2 per cent over half the period and  
18 after that, given the forecast is low moving forward, we  
19 believe this should come down to 2.1 per cent.  
20  
21 Given the time, that is the philosophy of how we have  
22 actually applied our review on the capex and opex side, so  
23 I hand it over to Jim.  
24  
25 MR COX: Thank you very much. The next stage is to  
26 proceed to the round table discussion. I will ask AGL to  
27 go first but, before we do that, I thought we might just go  
28 quickly around the table and give everyone a chance to  
29 introduce themselves, so if you could just say who you are  
30 and what your interest is, I think we will all appreciate  
31 it.  
32  
33 MS DAVEY: Susan Davey, EnergyAdvice.  
34  
35 MR McINTOSH: Andrew McIntosh, EnergyAdvice.  
36  
37 MR MARSHALL: John Marshall, Macquarie Generation.  
38  
39 MR GROVE: David Grove, Origin Energy.  
40  
41 MR WILLIAMS: Garry Williams, Country Energy.  
42  
43 MS PEARSON: Anne Pearson, EnergyAustralia.  
44  
45 MR LEONG: George Leong, Orica.  
46  
47 MS REED: Shelley Reed, TXU.

1  
2 MR LIVENS: Stephen Livens, Alinta.  
3  
4 MR DAVIES: John Davies, OneSteel.  
5  
6 MS GYZEN: Lynda Gyzen, Agility.  
7  
8 MR PRINGLE: David Pringle, from AGL.  
9  
10 MR BATES: Grant Bates, Agility.  
11  
12 MR YOUNG: Malcolm Young, Energy Consulting Group.  
13  
14 MR COX: And you know who we are. If I can start off with  
15 AGL - David.  
16  
17 MR PRINGLE: Just a few general comments to kick off the  
18 round table, if you like. First we would like to point out  
19 that prior to the appointment of ECG, Parsons Brinckhoff,  
20 who were contracted, reached a conclusion that AGL Gas  
21 Networks, were at the better end of the range of gas  
22 distributors in Australia and in terms of their performance  
23 indicators were lower at the costs per customer and cost  
24 per kilometre of mains in relation to other service  
25 providers and they were at the better end of the  
26 reliability indicators.  
27  
28 PB also found that since 2000 AGL has improved its  
29 relative performance in most of those indicators, including  
30 a 24 per cent real improvement on the operating costs per  
31 customer, which is quite significant.  
32  
33 With that as background, AGL has acknowledged that ECG  
34 recommended that 98 per cent of AGL's capex over the  
35 previous period, 98 per cent of proposed opex for the  
36 future period and 98 per cent of proposed capex should be  
37 considered, or it would be recommending to IPART, as  
38 prudent and efficient.  
39  
40 Having said that, AGL disagrees with many, or some but  
41 certainly not all, of the recommendations that ECG is  
42 putting forward and AGL will be putting written submissions  
43 putting a case for that. Most of those items are fairly  
44 technical issues in terms of why the costs are what they  
45 are so I would not intend to debate those issues today, but  
46 we will be putting our case in writing.  
47

1 Finally, I would like to point out that it is  
2 essential that the whole, or the various forecasts put  
3 together for the access arrangement, are consistent so  
4 that, for example, if the demand forecasts change it is  
5 essential that the forecast operating capital costs are  
6 changed to reflect that and, similarly, if IPART decides  
7 that certain items of capital expenditure such as program  
8 rehabilitation should not be allowed, that should be  
9 reflected in the allowable level of operating costs and  
10 unaccountable gas.  
11  
12 MR COX: Thank you.  
13  
14 MS DAVEY: No comment.  
15  
16 MR McINTOSH: No comment.  
17  
18 MR GROVE: Nothing from me.  
19  
20 MR WILLIAMS: Not at this stage.  
21  
22 MR LEONG: It is very difficult for Orica to comment on  
23 some of the costs because of the privileged nature of the  
24 correspondence but there is one cost, which is the market  
25 operations costs, about \$4.17m, which AGL said that it  
26 applied for, and the market operations costs is for the  
27 management of load shedding, the monitoring of gas quality,  
28 gas balancing and type B industrial and commercial  
29 appliance approvals. This is the third access arrangement  
30 and I would have thought those costs, that we would have  
31 paid for those somewhere else in the system, and I cannot  
32 understand why AGL wants additional moneys.  
33  
34 I would just like to point out that the gas balancing  
35 costs, the function is really spelt out in the gas market  
36 rules and that has been known all along, so I just need  
37 some clarification why this extra money has been asked for.  
38  
39 Managing load shedding, I can understand that, but  
40 we have not had any load shedding to date, I don't believe.  
41 The comments from the consultant regarding monitoring gas  
42 quality I agree with. Basically all they do is monitor the  
43 quality of the gas. There is no functionality there. I am  
44 not sure what type B appliance approvals are but I would  
45 expect that should be a user pays system.  
46  
47 MR COX: We will come back to Ed Teoh later. First of

1 all, I should ask whether there are any additional comments  
2 at this stage from people sitting at the table? Silence  
3 probably indicates absence of outrage.  
4  
5 MR LEONG: I can make some more comments.  
6  
7 MR COX: Perhaps I will ask David and Ed if they want to  
8 respond in any way first.  
9  
10 MR PRINGLE: The only real question appears to be in  
11 relation to those market operations costs. Our argument  
12 there was that in 2000 the efficient level operating cost  
13 was largely determined on a basis of comparison with the  
14 costs of the Victorian distributors and there is a  
15 significant level of costs of the order of \$4m a year where  
16 their functions are carried out by gas networks in New  
17 South Wales which are not carried out by the distributors  
18 in Victoria, so our argument was that our costs were  
19 unfairly determined in 2000 because of the fact that we  
20 incurred this \$4m of costs that Victorian distributors  
21 don't incur and it was not factored into the equation.  
22  
23 MR TEOH: I suppose when we looked at it, we considered  
24 what was actually done here in terms of the market  
25 operations aspect as compared to Victoria and certainly we  
26 do concur with some of the activities that are done here  
27 that are not done by the distributors in Victoria.  
28  
29 In terms of things like load shedding, there is a need  
30 to manage load shedding. There is a need to ensure that if  
31 something is required, for argument sake, a load shedding  
32 table, and drawing up that aspect, certainly from my  
33 experience in Victoria you would have to do something like  
34 that. It is not a once-off exercise that has to be done.  
35  
36 The other thing that you also speak about is I suppose  
37 the type B appliances. They are generally for, I suppose,  
38 the complex appliances, I will call them. In terms of New  
39 South Wales, it has been proved by AGL that they can be  
40 brought into service. In terms of Victoria, they have been  
41 done by the Office of Gas Safety, so we do recognise the  
42 fact that there are some costs that have been incurred here  
43 that in terms of the benchmarking exercise done earlier are  
44 probably not taken into consideration.  
45  
46 Having said that, we also said in terms of when we had  
47 discussions with AGL that we looked at activities and some

1 of the costs aspects of that, and in one particular part of  
2 it we did recommend a reduction because we thought it  
3 should be already included in terms of the opex component.

4  
5 MR COX: Thank you, so other comments?

6  
7 MR LEONG: The consultant made some comments about asset  
8 utilisation that I just don't understand, as well as the  
9 actual conclusion. Can you clarify what was the actual  
10 conclusion there? You basically said that there is some  
11 reduction in utilisation of the Sydney/Newcastle trunk and  
12 also the Sydney/Wollongong trunk but was there anything  
13 more spoken about that? It was just left there.

14  
15 MR TEOH: One of the things we had to look at was  
16 certainly asset utilisation in terms of the system. The  
17 main areas that we think in this area are relevant is in  
18 the primary mains side of things and we did that in terms  
19 of the Wollongong mains and the Newcastle mains. I suppose  
20 the way we approached it was, if you look at the capacity  
21 of a pipeline, the capacity of a pipeline is not what is  
22 contracted to supply but what we call a diversified  
23 contract capacity. What we then had to do was, given that  
24 situation, what was the load in both pipelines, how does it  
25 compare in terms of contract versus tariff load, and from  
26 the information that we had we then worked out roughly that  
27 if you look at it from a diversified system perspective,  
28 what is it that it is equivalent to in terms of a reduction  
29 in load as a result of a reduction in contract load. And,  
30 I suppose without actually going through the technical  
31 calculation, the conclusion that we drew was that from a  
32 diverse load perspective there is approximately 10 per cent  
33 reduction in the actual load.

34  
35 How is that applied moving forward? I suppose there  
36 is a whole series of questions that perhaps need to be  
37 answered. I am not sure if this is the forum to debate it,  
38 but certainly one of the issues would be, given the  
39 reduction in load, would that necessarily mean a reduction  
40 in the pipeline size itself? It is standard industry  
41 practice that you go on increasing pipeline size, and that  
42 is not necessarily dependent - it is not just a marginal  
43 increase, it depends on what the pipeline size is, say  
44 150mm to 200mm, not 150mm to 180mm, so there is a whole  
45 series of questions. In terms of identifying it from a  
46 diversified load perspective, we have estimated it is about  
47 a 10 per cent load reduction.

1  
2 MR LEONG: That is fine, I just wanted to bring it to  
3 everyone's attention, that is all.

4  
5 MR COX: Thank you for doing that. Is there anyone at the  
6 back of the room who would like to make a comment or  
7 question anything at this stage? If not, there is a final  
8 chance for comments from people sitting at the table.

9  
10 MR DAVIES: Can I just ask a question, maybe it is just  
11 some clarification: this market development number that we  
12 are talking about and the fact that you are allowing, I  
13 have forgotten the number, several million there for the  
14 development of the hot water system, is that captured in  
15 terms of the sales component? I was unclear. Clearly one  
16 does not go into investing in a market development without  
17 the anticipation that it will balance with the sales,  
18 therefore how do you reflect this? Are we talking about it  
19 as a cost to AGL? AGL must have clear plans to  
20 substantially grow the volume and the volume therefore  
21 justifies that expenditure surely?

22  
23 MR TEOH: I suppose what we looked at was the business  
24 case that has been put forward by AGL in terms of  
25 justifying this particular market initiative. In terms of  
26 the sales aspects, we certainly have not looked at the  
27 revenue side of things. What we have done is looked - when  
28 I say revenue side, the revenue side in comparison to what  
29 has been submitted in terms of the access arrangement -  
30 what we looked at is in terms of the revenue side in regard  
31 to justifying this project and whether the hurdle rate that  
32 AGL has put forward meets the hurdle rate.

33  
34 From our perspective, certainly what has been put  
35 forward does meet the hurdle rate. The business plan makes  
36 sense to us, so if the question is in regard to just  
37 looking at the project in isolation, yes, we have looked at  
38 that. The project in regard to the total revenue stream  
39 for AGL, certainly we have looked at that as well.

40  
41 MR PRINGLE: Can I just add to that and say that the costs  
42 or marketing costs of that scheme are allocated wholly 100  
43 per cent to the tariff market. It is designed to grow the  
44 tariff market volumes. We have that included as a separate  
45 line item in our demand forecast, the extra terajoules to  
46 grow from that, and that is what Ed was talking about, if  
47 we show that it is economically beneficial to spend that

1 money and get the load that we presume we will get, and we  
2 have shown over time because of that, because of the  
3 equation, it transfers back to the benefit in the medium to  
4 longer term straight to those tariff customers, so that  
5 extra load you just queried is built into our demand  
6 forecasts and we have demonstrated to the tribunal and to  
7 ECG that over time the tariff customers will benefit by  
8 lower tariffs because of their allowance of that initial  
9 marketing expenditure up front.

10  
11 MR DAVIES: Can I just add in response that obviously as a  
12 self-contracting industrial customer we would be hoping as  
13 you grow the tariff load that the larger customers might  
14 see that the better utilisation of your assets might  
15 benefit us in terms of not shouldering a larger share of  
16 the burden.

17  
18 MR PRINGLE: In some ways that would flow through to  
19 contract customers, you are right.

20  
21 MR COX: Further comments?

22  
23 MR WILLIAMS: My question is more a point of clarification.  
24 I read the term "metering", or "the cost of metering", and  
25 I was wishing to have clarification on how much of metering  
26 or what components might be included in that term, whether  
27 it is the meter itself, whether it is the meter and  
28 regulator, whether it is installation thereof?

29  
30 MR TEOH: Well, I suppose it depends. We have used the  
31 term "metering" in different ways. Where we have used  
32 metering in regard to say new customers, it is the cost of  
33 the total installation, but in terms of like a meter  
34 replacement program the term "metering" we would use in  
35 regard to the replacement of the meter itself, because in  
36 the report we have separately reported on the replacement  
37 of regulators, so it depends on I suppose which area we are  
38 talking about.

39  
40 MR WILLIAMS: The area that I had looked at specifically  
41 was on page 39 where the cost was discussed on mains,  
42 services and metering per customer and there was a figure  
43 of \$380 per customer written there.

44  
45 MR TEOH: It is a total installation cost in that  
46 category.

47

1 MR WILLIAMS: From?

2  
3 MR TEOH: From just the meter.

4  
5 MR WILLIAMS: That is the meter regulator, not the  
6 service?

7  
8 MR TEOH: Not the service, that is right.

9  
10 MR PRINGLE: That also includes in high-rise buildings  
11 there is a large cost per customer because of all the  
12 electronics to get the information back to the meter - and  
13 water meters as well.

14  
15 MR WILLIAMS: Water meters I think you have separately  
16 identified anyway.

17  
18 MR YOUNG: That includes not only the costs of those to  
19 the regulators but the physical cost of installing it as  
20 well as the costs of the components.

21  
22 MR WILLIAMS: Thank you.

23  
24 MR COX: Thank you. Another question or comment? I  
25 think we should perhaps close off the discussion here. You  
26 obviously do have the chance to make further submissions to  
27 us by 6 October. In the absence of further submissions, we  
28 have obviously the views of AGLGN and the views of ECG,  
29 which as David Pringle pointed out, do not differ that much  
30 at the end of the day, so we await further comments.

31  
32 PROPOSED TRUNK ZONE MERGER

33  
34 MR COX: The next session is on the five-zone versus the  
35 seven-zone issue. We will hear first from Sarina Fisher  
36 from the Centre for International Economics, who has been  
37 assisting the secretariat and the tribunal in understanding  
38 the issue - but I'm not sure that the tribunal does  
39 understand the issue. She will make a brief presentation  
40 and then we will follow it up with roundtable discussions.

41  
42 MS FISHER: As you will all be aware, one of the more  
43 significant changes in the proposed AA that has been raised  
44 in submissions is the proposal to merge the three Sydney  
45 trunk zones into one. So, effectively, customers  
46 delivering gas into the Sydney local networks would face  
47 the same trunk capacity reservation charges whether their

1 receipt point is at Wilton or at Horsley Park.  
2  
3 The submissions we received in the first round  
4 principally focused on the perceived costs of that merger.  
5 In particular there were several issues raised in terms of  
6 cost reflectivity, which is an issue for the gas code,  
7 because users are effectively paying for transportation  
8 across the length of the proposed zone A rather than, in  
9 some cases, users who are only using one or two of those  
10 zones.  
11  
12 There were also issues raised in terms of potential  
13 competition impacts given the removal of the price  
14 differential between shippers on the EGP the MSP and the  
15 consequences for the competitive situation in the New South  
16 Wales gas market.  
17  
18 In response to some questions raised by the tribunal,  
19 AGLGN has come back with additional information on the  
20 benefits that are up for grabs as a result of the zone  
21 merger and in particular how the gas swap service would  
22 work under, effectively, a five-zone structure rather than  
23 a seven-zone structure.  
24  
25 Essentially, we think that there are two key areas of  
26 potential benefit out there. One principally relates to  
27 the more effective operation of switches in short-term  
28 arrangements for a gas supplier between the different  
29 receipt points, improving the operation of the gas swap  
30 service by removing the network as a player in those sorts  
31 of arrangements and making them neutral to the arrangements  
32 that retailers or customers might want to strike in setting  
33 the swap arrangements, and also the gas swap service in  
34 terms of the receipt points swaps would themselves be more  
35 simple because you would be removing time delays involved  
36 in changing contractual arrangement, changing standing  
37 orders in GMC, changing annual capacity bookings and things  
38 of that nature.  
39  
40 Obviously the costs and benefits have been talked  
41 about amongst the secretariat and the tribunal for some  
42 time now. As Jim mentioned originally, no decision has  
43 been made yet and it continues to be discussed. But we are  
44 seeing this forum as an opportunity to take some of these  
45 issues a little bit further.  
46  
47 The new information that AGLGN has made available to

1 us on this issue was put up on the web site. I am not sure  
2 how much time people have had to digest it effectively, but  
3 we are interested in people's responses to it. I guess by  
4 implication, the proposed benefits that are available as a  
5 result of merging the three Sydney trunk zones imply that  
6 the existing system is essentially not well suited to  
7 changes in short term gas supply arrangements between  
8 receipt points, particularly of the small opportunistic  
9 kind, and that it was perhaps set up with long term  
10 customers in mind before retailers came into the picture  
11 and before the EGP was established.  
12  
13 We would obviously be interested in the demand in the  
14 market to improve the efficiency of those changes in  
15 short-term supply arrangements. This is an open forum and  
16 we are open to discussion on any issues that people have in  
17 relation to the trunk zone merger. There are three  
18 overarching issues that we would like to invite comment on  
19 if that will help our conversation here. Firstly, how  
20 beneficial are the increases in the efficiency of  
21 short-term gas supply arrangements to retailers and other  
22 stakeholders? For instance, do current arrangements under  
23 a seven-zone structure inhibit short-term shifts in supply  
24 from different receipt points; and, if so, to what degree  
25 of inconvenience and cost?  
26  
27 Secondly, is there demand for further wholesaling and  
28 trading opportunities out there in the market? We would be  
29 interested to know if more trading would occur, if it was  
30 facilitated by the creation of a regional hub, which in  
31 principle, it would be. Thirdly, coming back to many of  
32 the issues that were raised in submissions originally on  
33 the costs of the zone merger, what is the materiality of  
34 what are essentially small price changes - and very small  
35 in most instances - in the cost of delivered gas to  
36 customers and to competition in the New South Wales market?  
37  
38 MR COX: AGL would you like to comment at this stage  
39 before we start the roundtable discussion.  
40  
41 MR MARTIN: My name is Scott Martin from AGL. The  
42 tribunal asked us to actually address a bit of a shortfall  
43 in understanding as to what we are actually trying to do.  
44 There was a perception that there was a little bit of lack  
45 of clarity as what are the benefits and what is the  
46 flexibility and what is the simplicity of what we trying to  
47 do? Rather than directly answering those three questions,

1 that Sarina put up, I might go back to the start and have a  
2 bit of a look at why we have done what we have done and I  
3 think my going through that will actually answer those  
4 questions.

5  
6 Over the last three years there has been a variety of  
7 approaches to us to facilitate short-term transactions  
8 between users or between users and shippers that did not  
9 fit into their standard transportation arrangements. I say  
10 "standard transportation arrangements" in the sense that,  
11 at the moment, all our transportation services are point to  
12 point. So when you have a non-tariff delivery point  
13 service, that service goes from a specified receipt point  
14 to that delivery point. Gas is therefore defaulted -  
15 determined to come in at that receipt point for the load of  
16 that particular customers.

17  
18 In order to change the services to or change receipt  
19 of gas to another receipt point, therefore for a  
20 point-to-point service, you have to change the starting  
21 point. You have to shift it across to the other receipt  
22 point. That causes, firstly, contractual issues, because  
23 the user then has to come to Gas Networks to get a  
24 contractual variation to change the initial starting point.

25  
26 Since the advent of market systems, the receipt point  
27 or the delivery point is actually part of the standing data  
28 that is held in the gas market system. So there is a  
29 five-day transactional process to actually comply with the  
30 gas market business rules to keep your receipt point for a  
31 delivery point current. That is fine for long-term gas  
32 supplier arrangements, and I guess in the past that has  
33 been typically the way that the New South Wales market has  
34 evolved with long-term gas supply arrangements.  
35 Increasingly more and more users are starting to say, "Hang  
36 on. For the next two days I want to get 20TJ from this  
37 other receipt point"; or, "I want to get 20TJ from this  
38 other user because of some other arrangement in another  
39 state or take or pay commitments" - or whatever.

40  
41 There are commercial drivers going on between users  
42 and the wholesale marketplace and they are then looking for  
43 ways to express those and to work those things out.  
44 Presently, as I say, for us to cater for that arrangement,  
45 the change in receipt point is very, very inflexible. We  
46 sat down and said, "What do we want do to?" Number one, we  
47 want to get out of the picture. For us to do that, then it

1 is really important that we are commercially neutral on  
2 where the gas comes in - whether it is at Horsley Park or  
3 Wilton - and in 12 months time, there will be another  
4 receipt point operational in the current zone 2, which is  
5 at Menangle Park; so even more so the level of complexity  
6 will increase.

7  
8 With the point-to-point nature of the transportation  
9 services, charges are also based on that point. So when  
10 the point is at Wilton, there is a certain charge. When  
11 the point is at Horsley Park, there is another certain  
12 charge. The concept here is to say: let us take that  
13 zone, where there are three sources of gas coming into it,  
14 or you have gas from Victoria, South Australia, Sydney  
15 Basin, and make it one common pricing point. Then, from a  
16 commercial point of view, Gas Networks can basically step  
17 back and there is no longer a revenue recovery driver for  
18 us to ensure that transportation services and capacity  
19 booked is consistent with our contract carriage principles.  
20 By establishing a simple point node, then those same  
21 point-to-point principles can apply without the  
22 obstruction.

23  
24 Once you do not have to change the receipt point on a  
25 point-to-point service, then the requirement to change  
26 market rules does not change either because that receipt  
27 point is still that nominated for a particular delivery  
28 point; that is the way it is set up. We then take that  
29 basic existing transportation service structure - so there  
30 is no change to the services; the services that people are  
31 familiar with over the past few years do not change - but  
32 we overlay above it, I guess, a framework of facilitating  
33 gas transfer arrangements that are negotiated between  
34 users. In the same way that users currently make  
35 nominations, then it should happen in the same time frame.  
36 So, again, it is having that short-term - being able to  
37 spontaneously affect trades.

38  
39 That is basically what we wanted to do. We wanted to  
40 create some flexibility. We wanted to take any unnecessary  
41 contractual things out of the way and basically treat gas  
42 trades from a network balancing point of view as, I guess  
43 an allocation issue, an inventory reconciliation issue  
44 rather than a contractual point-to-point transportation  
45 issue. That is what we have tried to do, and that is what  
46 the aggregation of those three zones does.

1 If we retain the seven-zone structure, obviously we  
2 are not getting rid of those three separate pricing points.  
3 That means that AGLGN maintains a contractual interest in  
4 the way that non-tariff services are set up. It means that  
5 we are still going to go through a process of having to  
6 ensure that where a user wants to use another receipt point  
7 for a short-term period of time, then a capacity service  
8 has to be established there on the same principles as apply  
9 to any other capacity reservation service. So we are there  
10 creating a situation for the next five years where the same  
11 difficulties and inconveniences that users have expressed  
12 some frustration with over the past four years continue for  
13 that period.

14  
15 As I say, with another receipt point coming on, there  
16 are opportunities for trades and for more sophisticated  
17 operations in the wholesale market for growing maturity.  
18 That potential is there. I guess the solution we have  
19 tried to put in place here is that we can just step out of  
20 the way largely and then set things up so that trades then  
21 become just a part of everyday nominations rather than a  
22 contractual variation, then a five-day market transaction,  
23 and then a five-day market transaction, and change it back  
24 again after you have got your gas for two days. So we are  
25 trying to go to something that is actually workable and  
26 flexible. Those are the benefits of what we are trying to  
27 do and why the five-zone structure really is a big part of  
28 that.

29  
30 On the question of what are the competitive effects,  
31 we have done some pretty simple numbers. When you look at  
32 the price differential between Wilton and Horsley Park at  
33 the moment it is about 2.6 cents a gigajoule. Effectively  
34 what it comes down to, on an equivalent throughput basis,  
35 if you convert the capacity reservation charges, for an end  
36 customer who is, let's say, paying \$4 for his gas at the  
37 city gate plus network transportation, you are looking at  
38 about 0.3 of a per cent. That is certainly not a material  
39 number. We would speculate and propose that there are  
40 greater opportunities for greater savings through more  
41 dynamic wholesale activity and that 0.3 of a per cent is  
42 likely to be swamped quite readily by increasing the  
43 opportunities for different sources of gas and for  
44 different flexibility of users rather than tying them into  
45 their long-term agreements with very little flexibility to  
46 go elsewhere on short-term notice.  
47

1 It is a step away from cost reflectivity. We agree  
2 with that and do not dispute that. On the other hand,  
3 first, it is not material, as I have just highlighted, and  
4 I guess the second point is that it is really not  
5 inconsistent with other regulatory decisions.  
6

7 If you look at Northern Territory Gas or the Dampier  
8 to Bunbury pipeline, they are both decisions under the code  
9 and the zones there with much longer than the 69-kilometre  
10 zone that we are proposing. With Dampier to Bunbury, I  
11 think there are two zones that feed around Perth to the  
12 north and south. Both of those are over 110 kilometres  
13 long each. Both of those have in excess of eight delivery  
14 points each and they are all commonly priced. We are  
15 proposing a 69-kilometre zone, so that is entirely  
16 consistent with what has been proved elsewhere as being  
17 consistent with the code.

18  
19 That is basically what I had to say on that. I guess  
20 there are significant benefits that come from the five  
21 zones and in terms of the effects of competition, it really  
22 is not material and it has certainly not proven to be  
23 inconsistent with the code when we look at other  
24 jurisdictions.

25  
26 MR COX: Thank you very much. We will now proceed to  
27 comments from other stakeholders. Perhaps we could start  
28 with EnergyAdvice.  
29

30 MR McINTOSH: Firstly, Scott, 2.6 cents, what load factor  
31 was that based on?  
32

33 MR MARTIN: That is just 100 per cent.  
34

35 MR McINTOSH: 100 per cent load factor? My argument would  
36 be that that doesn't reflect the true usability of gas and  
37 that that figure would, in fact, be a lot greater, maybe up  
38 around the 4 to 6 cents mark. In a competitive commercial  
39 market that is a huge difference. That is one statement  
40 that I would like to make; that that is, in fact, a big  
41 advantage to those who are bringing the gas in to Wilton  
42 currently, which coincidentally would be AGL, I assume.  
43

44 Another other point I would like to make relates to  
45 the January crisis. You are talking about a four-day  
46 period. Can you just explain how you manage that because I  
47 believe that AGL brought the gas in to the Horsley Park

1 city gate at that stage; is that correct?  
2  
3 MR MARTIN: What we are talking about here is commercial  
4 transactions. Obviously, when there is shortage of gas  
5 supply and the choice of customers getting disconnected or  
6 getting gas in at another receipt point comes into play,  
7 then everyone works together to do what they can do. What  
8 we are really talking about here is the commercial  
9 transactions, when parties want to do it for their own  
10 commercial benefit, rather than for, I guess, an emergency  
11 supply situation. So they are two quite separate  
12 situations.  
13  
14 MR RAPISARDA: The other point there is that under the  
15 emergency supply situation, the Gas Market Company will  
16 suspend them.  
17  
18 MR McINTOSH: But you said that one of the advantages of  
19 going to five zones was to make administration easier.  
20  
21 MR MARTIN: Correct.  
22  
23 MR McINTOSH: My argument is that during a crisis you are  
24 able to do that anyway such as the 1 January crisis that  
25 you had.  
26  
27 MR MARTIN: As I have said, number one, the market rules  
28 with respect to gas balancing are suspended during an  
29 emergency situation. That only applies under certain  
30 criteria. If changing receipt point for a delivery point,  
31 then you would be obliged to go through a five-day  
32 transactions under the market rules to comply with the  
33 market rules.  
34  
35 In terms of AGL's commercial position, then, in those  
36 situations, we discuss those issues with the users at the  
37 time to make sure that it is commercially neutral. What we  
38 are talking about here is setting up a reference service  
39 that gives users the ability and the right under the access  
40 arrangement to access trades in a manner that meets their  
41 commercial environment. It is quite clear that, in the  
42 past, in adopting principles of the reference services that  
43 are set out the access arrangement, the requirement to  
44 change delivery points has not met those parties'  
45 interests.  
46  
47 MR McINTOSH: Thank you.

1  
2 MR COX: We will come back to you, if you wish.  
3  
4 MR GROVE: Nothing from me.  
5  
6 MS PEARSON: I have a couple of comments to make on this  
7 particular issue. EnergyAustralia is certainly supportive  
8 of the gas swap service, particularly once we received  
9 AGL's additional information we would acknowledge that it  
10 increases the flexibility for the gas trades. Having said  
11 that, EnergyAustralia thinks that that needs to be balanced  
12 against the issue of the price changes. Whilst Scott  
13 Martin suggested a figure of 2.6 cents per gigajoule as  
14 being not material, for a new entrant retailer trying to  
15 win customers, that is material and it is enough to  
16 discourage a customer from switching retailers. That has  
17 certainly been our experience.  
18  
19 Whilst we support the flexibility created by gas swap  
20 service, we think that it would be detrimental to  
21 competition, particularly in the smaller commercial  
22 industrial sector of the market over the next little while.  
23  
24 MR LEONG: I support AGL's proposal to have five-zones  
25 instead of seven. I believe that it is the only way we can  
26 establish a spot market for gas in New South Wales. Having  
27 the EGP delivery at Horsley Park, the MSP at Wilton, and  
28 Sydney Gas at Menangle Park all delivering to the same zone  
29 will facilitate that same transaction. I think it just  
30 makes sense. I don't know how much of the spot market we  
31 will have, but unless we have facilities to be able to swap  
32 gas, then we will never know.  
33  
34 MS REED: My biggest concern with the gas swap is whether  
35 it has to be an on-the-day swap or a trade like that. From  
36 a commercial perspective, I would like to be able to do  
37 whatever I want on a day and either supply the gas from  
38 Moomba on the day or supply the gas from Longford, and I  
39 will have to have contractual arrangements with whichever  
40 pipeline in order to do that.  
41  
42 I would like that ability, without having to go to  
43 another retailer and potentially have a swap with them, to  
44 carry that out on a day. It could be my misunderstanding  
45 of the service and how it works. That is certainly what we  
46 would be looking for in that sort of service in order to  
47 support that.

1  
2 MR LIVENS: We have already put forward fairly substantial  
3 submissions with respect to this issue. We have noted the  
4 new response by AGL to IPART in response to your letter to  
5 AGL. We intend to put in a further submission with regards  
6 to AGL's response.  
7

8 Just in general, you commented on materiality. You  
9 were interested in the materiality issue. I have to agree  
10 with EnergyAdvice and EnergyAustralia. It is a material  
11 amount. If you look at how much gas is going into Horsley  
12 Park at a point in time - I can't tell you how much that  
13 is; it is clearly commercially confidential - figures  
14 around 30TJ to 50TJ a day are pretty much what you are  
15 looking at. If you multiply that out by 2.6 cents you are  
16 looking at sums of up to half a million dollars a year.  
17 Over the access arrangement period you are looking at  
18 potentially up to \$2.5m. To the extent that that gas is  
19 being used by a new entrant, that is clearly a commercial  
20 issue and it makes it difficult for that entrant to enter  
21 the market, those are significant sums, and other  
22 comparisons are largely irrelevant, I believe.  
23

24 We spoke about the length of the proposed zoning, that  
25 it will be 69 kilometres or 79 kilometres, and that was  
26 compared against Darwin and the Dampier to Bunbury  
27 pipeline. The difference there is that the market is  
28 entirely different in those cases; there are sole pipelines  
29 supplying that market. There are not competitive forces in  
30 place. There are not two or three pipelines delivering gas  
31 into that particular market. I just think again that that  
32 analysis or that comparison is largely meaningless because  
33 the reality is the EGP is in competition with the MSP, and  
34 that is just not the case in the other pipelines.  
35

36 It seems to me that the gas swap service has two  
37 parts to it: There is user swap and the receipt point  
38 swap. In AGL's response to IPART's letter I think it was  
39 made pretty clear that in terms of the user swap the  
40 collapsing of the seven zones down to five does not really  
41 achieve too much. Whether it be five zones or seven zones,  
42 it is pretty much the same. So really all you are looking  
43 at is the receipt point swap. That is the key issue that  
44 needs to be looked at.  
45

46 A lot of this seems to revolve around GMCo's  
47 requirements in that if you have a change in receipt point,

1 you need to advise GMCo and that takes five days, or  
2 whatever the time frame is.  
3

4 I do not understand, if it is simply a name thing; so  
5 if we call those three zones, zone whatever, and then had  
6 different charging within that zone, would that mean that  
7 you would not need to advise GMCo of where that particular  
8 gas is coming from? You can answer that now, if you wish.  
9

10 MR MARTIN: But the receipt point is actually used for  
11 balancing. Otherwise if you do not know where a user is  
12 getting their gas from, then you have no view as to the  
13 view of the network inventory in terms of pipeline, under  
14 an OBA, that is essential. Under any other arrangement,  
15 then it is still necessary to maintain the view of the  
16 actual reality of where the gas is coming from.  
17

18 MR LIVENS: So how is that changed by having that?  
19 Changed for whom? Is it for AGLGN in the trunk section or  
20 in the --  
21

22 MR MARTIN: Under the five zones - we are getting into  
23 detail, I suppose. Basically the transfer of gas to the  
24 other receipt point we are proposing would be done by an  
25 overlaying adjustment to the inventory rather than by  
26 actually physically changing the receipt point. In doing  
27 that, we get the exact quantity of the trade transferred.  
28 So the exact quantity of the amount agreed between the  
29 parties is actually switched across to the receipt point  
30 rather than the whole demand of a particular delivery  
31 point.  
32

33 I guess the other side of the coin as well is the  
34 network's commercial position, and the fact is that we  
35 charge capacity reservation services based on the  
36 point-to-point services and the charge for that service.  
37 Where there is a difference in service, then the consistent  
38 services have to be set up to introduce that other receipt  
39 point for that user to utilise. Once they then physically  
40 change that receipt point, then the delivery point is, for  
41 balancing purposes, pointing across to that other site, we  
42 do need to inform GMCo. So it all ties together.  
43

44 MR LIVENS: I think I have raised this with you in  
45 previous meetings as well. It just seems to me I do not  
46 see why you cannot maintain the price differential and yet  
47 achieve the same service. On the EGP we regularly have

1 receipt point swaps, 24-hour turnaround, and it is just  
2 done. Sure, it takes a bit of administration but, in the  
3 scheme of things, someone changes the bill essentially, and  
4 a bit of balancing is required. It is just not a huge  
5 issue. That is just an observation.

6  
7 Another way you could achieve the same outcome is that  
8 not everyone, I imagine, would actually want the  
9 flexibility of having a gas swap service. So those who  
10 don't want it, would be paying for it effectively, even  
11 though they don't want it. I do not see why you could not  
12 necessarily provide that flexibility. You could have your  
13 different charging arrangements for the different zones.  
14 If someone does want the added flexibility of a gas swap  
15 service, then they pay a certain amount to have that  
16 flexibility. That would achieve the same outcome, I  
17 believe. I think we have discussed this before.

18  
19 MR MARTIN: There is a million ways to skin a cat. What  
20 we have tried to do is come up with something simple in  
21 recognition that we didn't want to make commercial  
22 transactions through gas networks so there was no  
23 requirement to establish transportation services and incur  
24 annual transportation charges and the like. The whole idea  
25 was to make it commercially neutral. That is the simplest  
26 and cleanest way to do it. Any other way of doing it is a  
27 bandaid approach, an ad hoc approach, and there are  
28 compromises all the way through. We have tried to bring  
29 some of those compromises out in that submission to IPART,  
30 just comparing the five zone versus the seven zone. It can  
31 work, but you lose the bulk of the benefit with the  
32 seven-zone structure.

33  
34 MR LIVENS: I am not convinced of that. You say to make  
35 it commercially neutral. Clearly it is not, it has a  
36 significant impact on shippers, so it may be commercial  
37 from your perspective perhaps. I think I have covered my  
38 points.

39  
40 MR DAVIES: It seems to me sitting around the table that  
41 we are a group of users and we probably all have our own  
42 objectives, but I support the previous speaker's comments  
43 there.

44  
45 I can understand my friend at the end, Mr Leong, who  
46 is a self-contracting user, and his position out of this  
47 exercise. OneSteel looks at the numbers for the 2.6 cents

1 through and I am bound by confidentiality agreements which  
2 would result in my tongue being removed if I said anything,  
3 but these numbers are material to us, and I am sure Scott  
4 Martin would be aware of that.

5  
6 The issue for us is that certainly we do take gas off  
7 the EGP and when I look at the haulage component and the  
8 comparison there of users, if you look at the delivered  
9 price of gas, and 2.6 cents is not material against that,  
10 that is not the issue, it is against the distribution cost  
11 that we face, and against that it is a material number.

12  
13 I also believe that in terms of the exercise that  
14 large users should be treated perhaps a little differently.  
15 We don't have the advantage perhaps of a retailer of  
16 attaching onto the bill a pass-through charge. I know they  
17 have got to be competitive and the like but they can  
18 probably get away with it more with the mums and dads than  
19 we can. We have to be internationally competitive and if  
20 we are seeing costs passed through which don't fairly  
21 represent our product, and our product costs, it would seem  
22 to me to be not in the interests of the nation either for  
23 this to be occurring, so I think our comment would be that  
24 if there was some mechanism in there that for the  
25 industrial, the large industrial users, who after all tend  
26 to be in the category that AGL referred to of the longer  
27 term, we are there and we have long-term contracts, that  
28 perhaps there needs to be some recognition of an alternate  
29 mechanism perhaps than having simply this blended costs  
30 being thrust upon us. If that is the way it works, that is  
31 the practice, then we can't have a more washed out costs  
32 perspective. That is about all I can add at this stage.

33  
34 MR COX: Scott, would you like to respond?

35  
36 MR MARTIN: Andrew, on your point about the 2.6 cents, I  
37 guess it really depends upon the load factor of a  
38 particular customer and whether it will vary from delivery  
39 point to delivery point.

40  
41 MR McINTOSH: No load customer has 100 per cent.

42  
43 MR MARTIN: As far as the total delivered cost to an end  
44 customer, the 2.6 cents is between point 3 and point 5 per  
45 cent. Even if you double that, even if you had a 50 per  
46 cent load factor, which is not very good, you still have  
47 less than 1 per cent. The question then becomes whether or

1 not the benefits of having the opportunity for wholesale  
2 trading to open up over the next five years is likely to  
3 return benefits greater than that to end customers.  
4  
5 I guess that is also the same response to Anne and  
6 Steve, just in terms of the materiality of it, you know,  
7 for an end customer, which is really the market that we are  
8 part of, or at least the gas networks is part of, that is  
9 sort of the question, whether the benefits from this  
10 actually outweigh that small change in cost reflective.  
11  
12 MS REED: I have seen customers transfer on less than that  
13 differential, even on one cent, if that is what it means to  
14 them. So, saying that it is not that material, customers  
15 do transfer on less than that and so it does have an  
16 impact.  
17  
18 MR MARTIN: What I am saying is that by doing this, it is  
19 a small amount, and I hear what you are saying, that you  
20 have got different views as to what is small, but I guess  
21 by doing this then you are bringing another element into  
22 play where the wholesale trading can get a toehold, so the  
23 question then becomes whether that is something that users  
24 actually want, whether they want the full flexibility of  
25 this or not and whether they think there is a benefit, and  
26 for IPART whether the net benefit is greater or not.  
27  
28 MS PEARSON: At the moment, as I alluded to before, if you  
29 are looking at the benefits of the service as opposed to  
30 the competition, we would have to say we think it is  
31 probably anti competitive, so at the moment, if we have to  
32 chose between one or the other, we would probably prefer to  
33 maintain the competition.  
34  
35 MR LIVENS: The key point is that there are ways of  
36 achieving the desired outcome we believe that don't have  
37 the same competition impacts. That is what we would like  
38 the tribunal to explore.  
39  
40 MR MARTIN: Shelley, on your question as to whether or  
41 not  
42 a user at one particular receipt point can access gas from  
43 another receipt point, under the five-zone structure all  
44 the common pricing loads that provide the upstream  
45 arrangements for gas are in place for that transaction, you  
46 are just nominating that other shipper.  
47  
48 MS REED: I am not physically doing a ship with any other

1 retailer, I am just nominating?  
2  
3 MR MARTIN: You can do a swap yourself, from within  
4 yourselves, so it does not require another user to be  
5 involved in the transaction.  
6  
7 That is really what we have tried to  
8 accommodate, so it is user to user, users between  
9 themselves, just shifting it from one receipt point to  
10 another, that all those things are done in exactly the same  
11 way rather than treating one a certain way and doing  
12 another transaction another way. With one transaction AGL  
13 has a commercial interest, so you have to go through this  
14 process, et cetera, and, Steve, as I said, there are ways  
15 of patching things together in doing it. The question is  
16 what is the smartest and the way of setting the reference  
17 services up under the access arrangements so that the same  
18 deal is there for everyone and everyone's access to the  
19 service is the same. The five-zone structure does that.  
20 In looking at all the options, that was the simplest and  
21 the sweetest trading mechanism.  
22  
23 Steve, on your comment on WA, that there is no other  
24 competitive pipeline there, I guess we are looking at cost  
25 reflectivity and that was my point. That is not to say  
26 that this arrangement would not be cost reflective in terms  
27 of the code. The fact that another regulator has deemed it  
28 to be cost reflective is what we are pointing at. I guess  
29 the other example I didn't mention there is the EGP itself,  
30 that although it is not a covered pipeline, certainly it is  
31 over three zones, Orbost/Longford in one zone, and in  
32 everything from Bomaderry to Horsley Park in another zone.  
33 It is the same. That is much larger than what we are  
34 actually proposing.  
35  
36 MR LIVENS: My point was, I am not talking about the  
37 ultimate length of the pipes or the zones in question, it  
38 is whether or not those particular sections of pipe are  
39 facing competition. Clearly when it comes to cost  
40 reflectivity you are never cost reflective across the board  
41 because you have to go down to the nth degree, but it is  
42 where you have competition within a market that you need to  
43 ensure that to the extent possible, the greatest extent  
44 possible, that you are cost reflective.  
45  
46 MR COX: I guess this discussion leaves me with two main  
47 thoughts. The first and interesting point is the people in

1 this room who would value and would use a gas swap service.  
2 That does interest me. Secondly, there is concern that the  
3 effect of moving from seven to five zones could adversely  
4 affect some shippers and retailers of gas and that it might  
5 encourage people to move suppliers. That is not an easy  
6 position for us. Who would like to take things further?  
7

8 MR LIVENS: I would like to repeat what I have said, that  
9 I believe you can achieve --

10  
11 MR COX: There may be other ways.

12  
13 MR LIVENS: You can achieve the benefits through other  
14 mechanisms, and I am more than happy spending time with  
15 yourselves to discuss those options.  
16

17 MR COX: That would be helpful, thank you. Any further  
18 comments on this? Anyone at the table want to have another  
19 go? Perhaps there is someone sitting in the back of the  
20 room. Sarina, or Scott, any final comments? Okay, thank  
21 you for the discussion.  
22

23 SHORT ADJOURNMENT.

24  
25 PROPOSED TERMS AND CONDITIONS  
26

27 MR COX: We will now commence the third session, which is  
28 on proposed terms and conditions. We are going to start  
29 off with a presentation by Ray Challen from the Allen  
30 Consulting Group. Ray has very kindly agreed to speak  
31 without showing his slides, and we thank him for  
32 accommodating us in doing that. He will make a brief  
33 presentation, then it will be followed up by round table  
34 discussion.  
35

36 MR CHALLEN: Thank you, Jim. The Allen Consulting Group  
37 was asked to review the terms and conditions for the  
38 reference services set out in what I will call the proposed  
39 access arrangement or the revisions to the access  
40 arrangement. We were asked to look at two things.  
41

42 Firstly, we were asked to look at were there any  
43 particular aspects of the terms and conditions that would  
44 appear to have a broad impact on users of the network and  
45 on customers for gas that would be inconsistent with the  
46 general principles of third party access regulation, in  
47 other words, that in themselves would be seen to inhibit

1 effective third party access to the network and the  
2 benefits that generally are accepted as flowing from that.  
3

4 Secondly, we were asked to look at the specific  
5 provisions of the terms and conditions for reference  
6 services, to look at are there any particular provisions,  
7 particular clauses, that are inconsistent with the specific  
8 requirements of the code in regard to terms and conditions,  
9 this being the reasonableness criteria under section 3.6 of  
10 the code. For the sake of clarity, just to repeat what  
11 that section actually says, section 3.6 of the code says  
12 that "an access arrangement must include the terms and  
13 conditions on which the service provider will supply each  
14 reference service and the terms and conditions included  
15 must in the relevant regulator's opinion be reasonable".  
16

17 I guess I will answer the first of those questions  
18 initially and get it out of the way. In terms of were  
19 there any provisions in the terms and conditions which  
20 could in themselves be seen to inhibit third party access  
21 our view was that there was not. There was no provision in  
22 the terms and conditions that could be seen to be  
23 inconsistent with effective third party access in itself.  
24 That does not mean that some of the provisions, the  
25 particular provisions, the particular clauses, could not be  
26 regarded as unreasonable in their own right. I will move  
27 on to that now.  
28

29 In looking at particular provisions of the terms and  
30 conditions we looked at a number of general matters as well  
31 as the particular elements of the terms and conditions, and  
32 I will look at these general matters first. Firstly, we  
33 looked at the manner in which the terms and conditions in  
34 the access arrangement were specified. There were  
35 submissions made on the proposed access arrangement that  
36 questioned the manner in which the terms and conditions  
37 were actually set out in the access arrangement and in  
38 particular raised issues of ambiguity, repetition and lack  
39 of clarity in the specification of the terms and  
40 conditions.  
41

42 Secondly, we looked at an issue of incomplete  
43 specifics of terms and conditions for reference services,  
44 that is, the past practice of AGL of actually establishing  
45 service agreements for reference services that contained  
46 terms and conditions that were in addition to those set out  
47 in the access arrangement and, indeed, the apparent

1 intention of AGL to continue doing that in so much as the  
2 terms and conditions set out in the access arrangement  
3 would generally be regarded as inadequate for a party to  
4 enter into a service agreement with AGL on the basis of the  
5 terms and conditions as set out.

6  
7 We looked at, in response to submissions made on the  
8 proposed access arrangement, the terms and conditions for  
9 non reference services, and I will briefly talk about that  
10 point now, that whilst some submissions did raise questions  
11 in regard to what is set out in the access arrangement as  
12 the embedded network service which had some terms and  
13 conditions specified, that is actually not a reference  
14 service under the access arrangement and in regard to the  
15 terms and conditions for that service the regulator has no  
16 role in the approval or non approval of those except if the  
17 regulator decided as a matter of the services policy to  
18 make that service a reference service.

19  
20 In the absence of a determination, or direction from  
21 IPART to consider the embedded network service in that  
22 context, it is not a matter considered in relation to the  
23 reasonableness of the terms and conditions under section  
24 3.6 of the code.

25  
26 I will put that matter aside. Finally, as a general  
27 matter we looked at the relationship and interaction  
28 between the terms and conditions for network access with  
29 the gas retail market business rules. Looking then more at  
30 some of those general matters, firstly, the manner in which  
31 the terms and conditions for reference services are  
32 specified and, as I have mentioned, there were submissions  
33 made that the proposed access arrangement and in particular  
34 the terms and conditions is drafted in a manner that is  
35 disjointed and repetitive and, indeed, that some of the  
36 terms used were unnecessarily clumsy, complicated and  
37 difficult to comprehend, confusing and repetitive.

38  
39 In addition, it was indicated that the specification  
40 of terms and conditions within the access arrangement and  
41 in multiple schedules to the access arrangement gives rise  
42 to a number of elements of duplication of terms and  
43 conditions and, indeed, inconsistencies in the  
44 specification of terms and conditions.

45  
46 In looking at this issue, we effectively have come  
47 back to the requirement under section 3.6 of the code as to

1 what a regulator is required to do and, indeed, does the  
2 requirement for the regulator to satisfy himself, or  
3 herself or both, of the reasonableness of the terms and  
4 conditions as to the clarity in which those terms and  
5 conditions are specified a matter that can be taken into  
6 account.

7  
8 After taking into account in effect a range of legal  
9 advice, a range of positions taken by regulators around the  
10 country to date on this issue, our view is that IPART would  
11 actually have limited ability to require amendment of the  
12 access arrangement simply to remedy perceived deficiencies  
13 in drafting. More specifically, that the poor drafting  
14 would only constitute cause for IPART to require amendment  
15 if the deficiencies in drafting were considered to cause  
16 the terms and conditions to be regarded in some sense as  
17 unreasonable.

18  
19 That may occur if the drafting was such as to result  
20 in the terms and conditions being specified in a way that  
21 leads to ambiguity in the understanding of rights and  
22 obligations and inconsistencies in duplicated provisions.  
23 While we would say that IPART would have a limited ability  
24 to seek amendment of the terms and conditions for the  
25 purposes of improving drafting, as a matter in itself we  
26 did find in our report to IPART that there were several  
27 instances of deficiencies that are exhibited as ambiguities  
28 or inconsistencies which can be addressed in regard to  
29 specific provisions.

30  
31 The second general issue was one of incomplete  
32 specification of terms and conditions for reference  
33 services and, indeed, we took the view in our report to  
34 IPART that the terms and conditions set out in the access  
35 arrangement do actually omit provisions on many issues that  
36 would be expected to comprise part of the terms and  
37 conditions under a service agreement. Indeed, my view is  
38 that AGL would have no problem in agreeing with that, that  
39 it reflects somewhat a difference in view perhaps on what  
40 the terms and conditions in an access arrangement are  
41 actually supposed to achieve.

42  
43 In this regard AGLGN does not actually rely on the  
44 terms and conditions as set out in the access arrangement  
45 but rather uses what may be regarded as a fuller and more  
46 detailed specification of terms and conditions as set out  
47 in standard reference service transportation agreements,

1 which for some reference services are published on AGL's  
2 web site.  
3  
4 Whether an incomplete specification of terms and  
5 conditions for reference services is or is not acceptable  
6 under the code is very much a matter that relies on the  
7 construction that is taken or the interpretation given to  
8 the section 3.6 of the code and other provisions of the  
9 code, which at the moment between regulators Australia-wide  
10 has been interpreted both as that the code requires a  
11 precise and complete specification of terms and conditions  
12 as well as that the code only requires a statement of  
13 important principal terms and conditions, so there are  
14 inconsistencies in precedents set by other regulators  
15 there.  
16  
17 However, I should add that as yet there has been no  
18 guidance provided by a court or an appeals body on that  
19 element of the code.  
20  
21 Our view, as set out in our report, is that it would  
22 be consistent with the intent of the code that the terms  
23 and conditions set out in the access arrangement would be  
24 sufficient for parties to enter into a service agreement on  
25 the basis of those terms and conditions and also that the  
26 code would act to prevent the service provider from  
27 unilaterally imposing any additional terms and conditions  
28 to those set out in the access arrangement. But, as I have  
29 said, the construction of the code in that respect is open  
30 to different interpretation and, in the absence of any  
31 guidance provided by a court or an appeals body, IPART is  
32 going to have to come to a view itself on the construction  
33 of the code in that respect.  
34  
35 Moving onto the third general matter, the interaction  
36 of the terms and conditions with the gas retail market  
37 business rules, as most of you would be aware the gas  
38 retail market business rules are regulatory arrangements,  
39 or established under regulatory arrangements, that provide  
40 for the operation of the gas market and the gas retail  
41 market business rules contain their own process for change  
42 in those rules by consultation and agreement by  
43 participants.  
44  
45 Almost unavoidably the gas retail market business  
46 rules deal with a range of matters and potentially deal  
47 with a wider range of matters that are also dealt with

1 under the access arrangement and the terms and  
2 specifications for reference services, and some examples  
3 include such matters as metering and gas balancing.  
4  
5 Obviously any conflict between the gas market business  
6 rules and the terms and conditions should be avoided simply  
7 for effective operation of the gas market and third party  
8 access. How that conflict is to be avoided, though, is a  
9 matter of some difficulty.  
10  
11 The gas retailers and people participating in the gas  
12 market are required by law to comply with the gas retail  
13 market business rules, which would create a problem if they  
14 were bound to some contradictory provisions under contract  
15 with AGLGN for third party access. How could conflict  
16 therefore be avoided? We have stated a view on this in our  
17 report, albeit we see it as a matter that probably extends  
18 beyond or needs consideration beyond the context of the  
19 access arrangement. Indeed, it is very much a matter that  
20 falls into the realm of government policy on gas markets.  
21 However, for the purpose of assessing the terms and  
22 conditions, we would see it as important that the terms and  
23 conditions for access as set out in the access arrangement  
24 do not seek to replicate the provisions of the gas retail  
25 market business rules. Indeed, where the terms and  
26 conditions in the access arrangement address matters that  
27 are addressed under the gas retail market business rules  
28 they should exist in the context of reserve provisions only  
29 where, for one reason or another, the gas retail market  
30 business rules cease to be effective.  
31  
32 Secondly, and relatedly, we recommend that the terms  
33 and conditions should not seek to supplement the gas retail  
34 market business rules except where such supplementation is  
35 beyond the jurisdiction of the gas market company.  
36  
37 That deals with those three major general issues.  
38 Moving on to a number of specific elements of the terms and  
39 conditions, as I previously mentioned, the code requires  
40 that the regulator be satisfied that the terms and  
41 conditions set out in the access arrangement are  
42 reasonable. That does not necessarily help a great deal  
43 until you come to some understanding of what you might mean  
44 by reasonableness. For that purpose, we have set out a  
45 number of criteria for how it might be considered when  
46 looking at the terms and conditions.  
47

1 These criteria against which we made our assessment  
2 and recommendations to IPART are, one, that reasonableness  
3 requires that the terms and conditions be complete, that  
4 they be internally consistent, that they be unambiguous,  
5 that they reflect common industry and/or commercial  
6 practice, and, in taking that further, they need to be  
7 consistent with other law that affects commercial practice  
8 in the nature of contractual arrangements.

9  
10 So looking at these criteria, we did actually go  
11 through a fairly detailed process of looking at particular  
12 provisions and particular clauses of the terms and  
13 conditions. It was a somewhat lengthy process, although I  
14 think the report was actually easier to write than it would  
15 be to read. However we did find several instances where  
16 there were provisions that we think might not meet these  
17 criteria of reasonableness. I will mention some of the  
18 major ones of those where we actually saw there were issues  
19 of substance at stake. I will skip the ones where we were  
20 concerned more with issues of ambiguity.

21  
22 Firstly, there was an issue of some qualitative or  
23 quantitative limit on the level and type of security that  
24 AGLGN may require in regard to service agreements. This is  
25 a matter on which different regulators around the country  
26 have again taken different positions, and, indeed,  
27 governments have taken different regulatory positions.

28  
29 In some cases like Victoria, there are actually  
30 separate regulations in place which exist in addition to  
31 the access arrangements which themselves specify particular  
32 criteria for determining a level of security under service  
33 agreements. In other cases, service providers have  
34 themselves set out more detailed criteria for the  
35 specification of security, and, in other cases again,  
36 regulators have been satisfied that a constraint on the  
37 service provider to be reasonable in setting security  
38 requirements is sufficient. Indeed that latter case is one  
39 that exists under the proposed access arrangement: that in  
40 setting levels of security, AGL would be bound by a  
41 qualitative constraint of being reasonable in setting  
42 security requirements.

43  
44 We did not take the position in our report of saying  
45 where in this broad range of precedents on the regulatory  
46 decisions IPART should land on making a determination on  
47 this issue; however, we were concerned that where AGL is

1 only bound by a reasonableness requirement, there are no  
2 dispute resolution mechanisms in the actual terms and  
3 conditions as set out under the access arrangement. This  
4 consideration that we have taken here relates not only to  
5 the matter of the setting of security but to a number of  
6 other elements of the terms and conditions where AGL would  
7 be bound by this qualitative reasonableness requirement.

8  
9 As a general proposition we would propose that that  
10 would only meet the reasonableness provisions of the code  
11 where there is actually an effective dispute resolution  
12 mechanism that has been either demonstrated to be effective  
13 or found to be effective, and generally regarded to be such  
14 by users, or has been subject to the scrutiny of a  
15 regulator.

16  
17 Secondly, there is an issue in the nature of overrun  
18 charges and the extent to which these constitute a charge  
19 for a service or a charge that is in the nature of a  
20 penalty. For those who maybe have kept an eye on the  
21 proceedings with access arrangements outside of New South  
22 Wales, this is a very significant issue in Western  
23 Australia at the moment where Western Power is in a dispute  
24 I guess with the regulator with regard to overrun charges  
25 and other like charges with the Dampier to Bunbury natural  
26 gas pipeline where they are claiming that charges in the  
27 nature of a penalty - in other words, where a charge does  
28 not reflect a cost incurred or likely to be incurred by the  
29 actual service provider - is actually illegal.

30  
31 The Western Australian regulator - and this is  
32 actually described in the final decision on the Dampier to  
33 Bunbury pipeline for those who are interested - actually  
34 found that there was no clear and unambiguous legal opinion  
35 to be found here. However, it is at least possible that  
36 that may indeed be the case: that the charges that are in  
37 the nature of a penalty - in other words, charges that are  
38 imposed with the intent of modifying behaviour of a person  
39 without being cost reflective in some way - may actually be  
40 illegal, noting that there is no unambiguous legal position  
41 on that.

42  
43 Having said that, though, that is a matter that is  
44 currently before the Gas Review Board in Western Australia  
45 as a subject of appeal on the regulator's decision in  
46 regard to the Dampier-Bunbury natural gas pipeline. So  
47 there may be some more guidance available there.

1  
2 There are a number of other specific elements.  
3 Another main one relates to some ambiguity in the intended  
4 term of service agreements and also the effect of  
5 provisions relating to extensions of service agreements.  
6 While in the access arrangement proper AGL has set out  
7 certain minimum terms and certain terms for the reference  
8 services, in the clauses relating to the extensions of  
9 terms, there is some implication that the terms of the  
10 contracts for reference services are only intended to be,  
11 in effect, for the term or to coincide with the term of an  
12 access arrangement or at least for some of the rights of  
13 users to be circumscribed if the contract term extends  
14 beyond the term of the access arrangement. In our view,  
15 certainly with the information made available to us in this  
16 review, there is no particular reason why that constraint  
17 should be in place, and no reason why the term of a service  
18 agreement should necessarily coincide with that of the  
19 access arrangement.

20  
21 There are some other issues here in regard to  
22 liability. Liability, obviously is liability under the  
23 service agreement. The service agreement is a matter that  
24 is affected by law outside of the gas code in relation to  
25 the body of law that deals with liability under contracts.  
26 However, there are a couple of liability issues that we can  
27 address from an access point of view.

28  
29 Firstly, we saw that there was an excessively broad  
30 potential liability of users under access agreements, under  
31 service agreements in respect of gas swaps and also in  
32 respect of load shedding to the extent that that liability  
33 was not reasonably shared with AGL in circumstances where  
34 AGL may have failed to act in good faith in implementing  
35 its own contractual obligations.

36  
37 MR COX: You need to wrap up.

38  
39 MR CHALLEN: The final significant issue that was addressed  
40 in submissions on the terms and conditions related to load  
41 shedding priorities. As I just mentioned, there was a  
42 substantial concern amongst parties making submissions that  
43 load shedding priorities for gas transportation through the  
44 network should be related to the cause of the supply  
45 shortfall and to the nature of the end users of gas  
46 affected by any load shedding.  
47

1 Our view was that this would actually be difficult to  
2 address through the terms and conditions for a number of  
3 reasons; first, that load shedding priorities affect  
4 non-reference services as well as reference services and  
5 the regulator does have a limited ability, indeed no  
6 ability, to make decisions in relation to the terms and  
7 conditions for non-reference services; second, that there  
8 are actually complex information requirements necessary to  
9 link end users of gas with supply sources, and indeed there  
10 may be no direct link; and, third, it is an area where  
11 there would be interaction or potential interaction with  
12 the gas retail market business rules.

13  
14 For this reason, while we acknowledge the concerns  
15 that parties had about the load-shedding priorities, we  
16 considered it would be a matter that would need to be  
17 addressed in a forum outside of the access arrangements and  
18 the access law perhaps through the gas retail market  
19 business rules, if the jurisdiction of the Gas Market  
20 Company extends to that. Thank you.

21  
22 MR COX: Ray, thank you very much. AGL, do you want to  
23 make any comments at this stage?

24  
25 MR MARTIN: I will just make a bit of a general comment.  
26 AGL has made a response to the draft report, and that is  
27 actually on the tribunal's web site. There were a few  
28 fundamental differences of view between ourselves and  
29 Allens, but we found that in a lot of the other sections  
30 really, Allens were finding things to be reasonable or they  
31 were just raising points of clarification.

32  
33 In terms of the response to the draft report, I would  
34 just note that we have responded positively to all of those  
35 19 recommendations on the basis that they really are just  
36 clarifying the existing intent and what is actually  
37 intended.

38  
39 Some of those major items that were just mentioned -  
40 the terms and conditions, the manner of specification, the  
41 market rules - all those issues we have actually addressed  
42 in our submission, and also the market rules included a  
43 response from the gas market company. So I think our  
44 comments are adequately set out there. As to the other  
45 points that were raised I think we have also commented on  
46 all of those as well. So there is probably not much  
47 point in going into it in a lot of detail.

1  
2 MR COX: Thank you. We will now proceed to roundtable  
3 discussion. Obviously there are a number of general issues  
4 that Ray Challen raised, such as the extent to which the  
5 access arrangement should include complete specifications  
6 of terms and conditions, the interaction with the gas  
7 retail market rules, and the extent of inconsistencies and  
8 ambiguities in the terms and conditions. Those are three  
9 general issues. There are a number of specific ones, such  
10 as liability, indemnity, load shedding, security payment  
11 and so on. All of that embraces concerns by Allens. We  
12 would be most interested in the views of the stakeholders  
13 on any of those issues. We will start off with  
14 EnergyAdvice, if we may.

15  
16 MR McINTOSH: To IPART I'd like to bring a couple of  
17 points of note. Firstly, on page 15 and 16, section 3.4,  
18 you make reference to the fact that there are certain  
19 services that are treated as non-reference. Our suggestion  
20 is maybe that some services should be considered to be made  
21 reference so that they can be covered as well.

22  
23 Also on page 34, 35, section 4.9, there was an ACG  
24 claim that there was no submission addressing metering.  
25 You make reference to our submission. In section 8, page  
26 10, we made the submission that metering should be  
27 contestable. On page 78 and 79, in talking about load  
28 shedding there was reference there to embedded services  
29 which was given a rating of around about 2. That was  
30 another reason why we felt that that should be considered  
31 for reference as a reference service because there will be  
32 some instances where there will be higher priority services  
33 embedded in that that will be classified as a 2 where they  
34 shouldn't be.

35  
36 At page 81, reference is made to a coupled service.  
37 This is where, to get a local network service, you also  
38 have to contract to a trunk service. We feel that there  
39 again should be some sort of representation that you can do  
40 them separately as well.

41  
42 Area 5.6 again refers to the metering and to access to  
43 meter data. In our submission, we argued that this should  
44 be available to the end user as opposed to the contracted  
45 user, which is the retailer, and requires their consent.  
46 We feel that there should be an ability for the consumer to  
47 get access to their data on a more readily available

1 process.

2  
3 In reference to term you made the finding that the  
4 one-year term you felt was reasonable. In our submission,  
5 we made the point that we felt that there were instances  
6 where that is not reasonable. You made the statement that  
7 you could trade capacity, but it is our understanding that  
8 this is not practical unless it is upstream of the point of  
9 delivery because the network services are point to point.

10  
11 Also in reference to backhaul tariffs we feel that  
12 there should be an appropriate tariff so that there could  
13 be the possibilities of backhauling within, say, areas of  
14 Newcastle. I think that covers everything that I have to  
15 say right now.

16  
17 MR MARSHALL: I would just like to make some comments in  
18 relation to a matter that Macquarie Generation is  
19 interested in. We ask that the tribunal release the final  
20 MMA demand report for review by interested parties.  
21 Macquarie is concerned that MMA has simply dismissed the  
22 prospect of Macquarie Generation's gas turbine project as  
23 potentially proceeding.

24  
25 The Tomago project is fully approved, it has a DA, and  
26 is targeting to commence during the term of the proposed  
27 access arrangement. The access arrangement, we are  
28 concerned, must have regard for the terms and conditions  
29 required for a peaking power plant. It currently does not  
30 provide sufficient flexibility for virtually anything other  
31 than an MDQ booking on an annual basis. We ask that the  
32 access agreement be looked at very closely and at the terms  
33 and conditions required for a third-party pipeline  
34 connection to the AGL system. Again that is a very costly  
35 arrangement.

36  
37 MacGen will submit a detailed submission to IPART to  
38 look at and develop these points.

39  
40 MR COX: Thank you very much. We look forward to your  
41 submission. On the MMA report I think our intention is to  
42 release it with our own draft report. So there will be  
43 opportunity for further consultation following the release  
44 of the draft report.

45  
46 MR MARSHALL: What will be the timing of that? Will that  
47 be next year?

1  
2 MR COX: The draft decision, I am told, is coming out in  
3 November.  
4  
5 MR GROVE: There were no major issues but we did find some  
6 of the same issues that Allens Consulting identified. I  
7 guess one of the key issues was objectivity of triggers for  
8 security deposits and so forth. I am not aware of any  
9 other access arrangements that don't have objective  
10 triggers, so we believe that is an issue and that it could  
11 lead to anti competitive conduct if there are no objective  
12 triggers. That is just one issue but we will come up with  
13 something more in the near future.  
14  
15 MR WILLIAMS: At this stage we just note those things  
16 being discussed and we will give submissions later.  
17  
18 MS PEARSON: We are currently considering the lengthy  
19 report and we will probably be making some written  
20 submissions about it, but I guess from our perspective when  
21 considering section 3.6 of the code we are looking that the  
22 regulator be satisfied that the terms and conditions are  
23 reasonable and, Ray, you mentioned some criteria there that  
24 they be complete, internally consistent and unambiguous,  
25 for example. A further criterion perhaps needs to be added  
26 and that is that when you are looking at whether or not the  
27 terms and conditions are reasonable you have to look at  
28 that from the point of view of a new entrant retailer.  
29 That is really Energy Australia's comments on the terms and  
30 conditions and in particular our view that the terms and  
31 conditions, the complete terms and conditions, should be  
32 attached to the access arrangement for a new entrant  
33 retailer to go through all of those terms and conditions  
34 and work out - because everyone knows what our comments  
35 are, I guess, we have provided lengthy comments on that  
36 aspect - but it really is a lengthy and expensive exercise  
37 to go through that access arrangement against the service  
38 agreement that AGLGN provides to users from time to time.  
39 It is costly, and when I compare what EnergyAustralia went  
40 through last time round with the New South Wales access  
41 arrangement and how it has been dealing with access  
42 arrangements in other jurisdictions I have to say that it  
43 was a much more painful process with AGLGN than it has been  
44 with other network operators.  
45  
46 That is really the only point I would make now. We  
47 will be considering some of the specific terms and

1 conditions and getting some further legal advice,  
2 particularly on liability.  
3  
4 MR COX: Thank you.  
5  
6 MR LEONG: I have just got a comment to make regarding  
7 overruns. I have a capacity reservation service and the  
8 way I control that is, while controlling the number of  
9 overruns I am allowed - I am only allowed a certain number  
10 per any core period - I control it by not allowing  
11 additional capacity. I have to nominate it for a 12-month  
12 period. I do it by summer tranches, which I can nominate  
13 between October and April, or short-term capacity requests,  
14 which are valid from one week to four weeks.  
15  
16 All of those are subject to availability, which I  
17 don't have a problem with, but one I do have a problem with  
18 is the short-term capacity. That is subject to certain  
19 criteria which have to be approved by AGLGN and I just  
20 recently made a request for short-term capacity for four  
21 weeks and it was basically refused because AGLGN didn't  
22 think it conformed to the access criteria. I don't believe  
23 there should be access criteria for a maximum four weeks  
24 short-term capacity request. I think if our business  
25 requires that much gas, and if AGLGN has the capability of  
26 supplying that, they should provide it, no questions asked.  
27  
28 MR DAVIES: A couple of issues. In terms of the Ts and Cs  
29 we are talking about here, where we have got users such as  
30 in the OneSteel case here and we are looking at issues like  
31 the security issue, there are specific issues you will run  
32 against in terms of how businesses are structured, some of  
33 the banking covenants and the like that businesses may  
34 face, and I believe that it should be fair and reasonable  
35 that the way that this is structured encourages businesses  
36 in New South Wales. For a new venture to come in, set up,  
37 banks are likely to have covenant provisions in terms of  
38 how they can or what sort of guarantees they are giving to  
39 other parties and where you fit in the feeding line, and I  
40 think IPART should reflect the practical realities that  
41 exist.  
42  
43 Also it would be very hard if our directors were being  
44 imposed with personal liabilities. That would be very  
45 counter. You need to recognise certain basic things in  
46 that security area, that companies will be discouraged to  
47 come to New South Wales if that is the sort of thing that

1 can be imposed.  
2  
3 With overruns, I support what George Leong has  
4 commented on. We should be here about encouraging the  
5 efficient and maximum utilisation of systems. I notice  
6 EnergyAdvice commenting about overruns, MDQs and the like.  
7 We see across Australia that pipes are wherever possible  
8 trying to divert away from the regulated charge and trying  
9 to build in draconian and one would say not cost reflective  
10 penalties, and they are penalties which in fact are having  
11 a negative effect on the way operations run. I will say no  
12 more on that, but companies will respond to that and it  
13 won't necessarily be good for the overall economics of the  
14 country.  
15  
16 I simply point out that in the Newcastle case,  
17 although my friends at Macquarie will put a peaking plant up  
18 there, it would appear that the current facility is  
19 under-utilised so one would argue that penalty charges are  
20 entirely unreasonable in the way they are structured  
21 because they are very aggressive, they get to a form where  
22 they are almost exponential, which will restrict the  
23 willingness of businesses to invest in the way they  
24 operate.  
25  
26 The other aspect of course is liability. We support  
27 the concerns of people here. Liabilities for users should  
28 be generally capped. To have uncapped or open-ended  
29 liability provisions really is a major problem to a user.  
30 They will go hunting those of us in the room with enough  
31 assets to sue, I guess, so that is another area.  
32  
33 I can't talk about curtailment because I really don't  
34 know what the final position is in New South Wales. I am  
35 concerned about that. Obviously IPART will take that into  
36 account going forward.  
37  
38 They are just a few of my comments. I guess we will  
39 be constructing a document to send to you to reinforce some  
40 of these points. Thank you.  
41  
42 MR COX: AGL, if it wants to comment; then back to Ray  
43 Challen.  
44  
45 MR MARTIN: As I say, most of the points we have actually  
46 commented on in the actual submission, but I will run  
47 through some of these. On some of Ray Challen's points

1 there on security and just the absence of dispute  
2 resolution provisions, the code is pretty clear that there  
3 is a dispute resolution provision under the code and that  
4 if the service provider is found not to act in accordance  
5 with the access arrangement then users have every right and  
6 opportunity to involve the tribunal in an access dispute  
7 under the code. There is a dispute framework that is  
8 already there. I guess what you are talking about is  
9 whether or not the terms and conditions should say that,  
10 that a service agreement should include a dispute  
11 resolution clause. That is certainly the case at the  
12 moment, so when you start getting into those general  
13 commercial questions and legal issues I think they are  
14 things that we believe are better left to negotiation  
15 between the parties and leave the access arrangement to  
16 deal with things that are material, definition of service  
17 and references.  
18  
19 Most of the things that have been commented on we have  
20 actually mentioned in the report. The only point there is,  
21 as George Leong mentioned, the short-term capacity. George  
22 identified that there is some flexibility there to actually  
23 manage his capacity booking with additional capacity in  
24 summer tranches and short-term capacity, the basic  
25 principles of contract carriage, and Allens also recognised  
26 in the report that it is normal and consistent and not  
27 unusual for contract carriage capacity to have a 12-month  
28 term on it. Short-term capacity for greater than 30TJ  
29 customers is the same as in the current access arrangement  
30 and it is really there for circumstances that happen  
31 totally outside the control of the party and that are  
32 really linked to a mechanical break down type event. I  
33 don't know your particular circumstances but I guess I just  
34 want to reinforce that there are quite clear criteria  
35 around that at the moment.  
36  
37 MR LEONG: I want those criteria removed because I can't  
38 see why we should have to comply. If I have a business  
39 requirement for additional gas for four weeks or less and  
40 the gas is available, capacity is available, I should be  
41 given that capacity.  
42  
43 MR MARTIN: Again, the intent is that the capacity is  
44 booked for a period of 12 months. The charges of the  
45 access arrangement, the total structure, is based on that  
46 principle. There is no diversity factored in, it is  
47 factored in on the basis and forecast on the basis of

1 12-month terms. Changing those sorts of principles - and  
2 this also applies to overruns - changing the basic nature  
3 of overruns requires a reasonable capacity booking to be  
4 made and really undermines the fundamental structure and  
5 goes really back to first principles.

6  
7 MR LEONG: I agree that you book capacity for 12 months.  
8 I agree there are tools to manage my overruns. I am just  
9 focusing on one tool, and one of the tools is a short-term  
10 capacity request I can make between seven days to four  
11 weeks, and the access arrangements say you can only comply  
12 with four or five situations and that AGLGN has the ability  
13 to decline my request because they don't believe it fits in  
14 to one of those classifications. I believe that those  
15 classifications should be removed, that if I have a  
16 business requirement for that gas for that short term, I  
17 should be given it if it is available.

18  
19 MR RAPISARDA: The whole concept of short-term tranches  
20 for one month or whatever is completely inconsistent with  
21 the basic price structure and the only reason they are  
22 there is we have agreed to provide them for circumstances  
23 outside the user's control, because if they were there at  
24 the user's discretion it completely undermines the price  
25 structure and is inconsistent with the 12-month capacity  
26 reservation. They can't go together.

27  
28 MR MARTIN: Just following on from that, the other point  
29 was the overrun charges are based on the actual withdrawals  
30 at delivery point. They are based on the reference tariff,  
31 so what they effectively do is kick in where the original  
32 MDQ booking, which is up to the user to nominate, did not  
33 reasonably reflect the needs of that delivery point. So  
34 they are based on actual quantities. They are reflective  
35 of the utilisation of that point and are not an arbitrary  
36 penalty. As I say, all the other points we have covered in  
37 our submission.

38  
39 MR COX: Thank you. Ray, any comments you would like to  
40 make?

41  
42 MR CHALLEN: Only I guess to reiterate that not only is  
43 there some ambiguity in the way the code should be  
44 interpreted in regard to terms and conditions, which  
45 obviously some of this dispute is about, then IPART has an  
46 unenviable job in having to take a stance on these issues  
47 given the somewhat diverging stances taken by other

1 regulators under the code around the country.

2  
3 As I often tell regulators that we are advising from  
4 time to time, the appeals process is a valuable part of the  
5 regulatory framework and one with which regulators  
6 invariably disagree, but it is only with appeals and  
7 working through some of these issues that there are clear  
8 precedents set, and there is actually a growing body of  
9 precedent through appeals in both the courts and merits  
10 bodies as to how the code should be interpreted and,  
11 indeed, some further guidance will be provided by the  
12 current appeals on those which will address some of those  
13 issues that are obviously in contention here.

14  
15 The second general point would be that there are  
16 boundaries, if you like, between what should be addressed  
17 in the terms and conditions, what should be addressed as  
18 part of a services policy, what should be addressed as part  
19 of the gas retail market business rules and what indeed  
20 should be outside of regulation altogether. Again, a lot  
21 of the matters raised here relate to that and, just as an  
22 example, the availability of metering services is something  
23 quite clearly addressed by the gas retail market business  
24 rules and the opportunity for contestability in metering,  
25 and indeed that is something where the people administering  
26 the regulatory framework have to be quite clear about the  
27 boundaries between an access arrangement and a gas retail  
28 market business rule so we don't have duplication and  
29 administrative difficulties in administration.

30  
31 Without getting into particular issues, I think that  
32 is all the general comment I have to make.

33  
34 MR COX: Are there further comments from people sitting  
35 around the table at this point?

36  
37 MR RAPISARDA: One quick comment. Ray Challen  
mentioned a

38 couple of times, perhaps there is some confusion, in terms  
39 of contestability of metering. The access arrangement, as  
40 written last time, and as we are proposing this time,  
41 allows for contestability, and there are provisions in  
42 there which applied before contestability and after  
43 contestability and they just kick in whenever the market  
44 becomes contestable and they are totally consistent with  
45 the way the Gas Company deals with that changeover. I am  
46 happy to talk about that further.

47

1 MR CHALLEN: There is no issue from our point of view on  
2 contestability and metering.  
3  
4 MR COX: Any further issues people would like to raise?  
5 Someone sitting at the back of the room, perhaps, any  
6 issues? Any issues we have not discussed today that people  
7 would like to draw to our attention because this is really  
8 your last chance to do that, this and the submissions,  
9 before our draft report.  
10  
11 If not, thank you very much for that. I remind  
12 everyone that the closing date for submissions is 6  
13 October. As we have undertaken to provide a draft report  
14 during November, it obviously is extremely important for us  
15 to be able to meet that deadline that your submissions are  
16 provided by 6 October. I do commend to people who are  
17 making submissions on the subject matter of the last  
18 session that they read both the Allens report and AGL's  
19 response to it, as I think that does provide the context in  
20 which further submissions will be useful to us. I commend  
21 those documents very much to anyone who wants to take this  
22 further.  
23  
24 Finally, thank you to the participants today, both my  
25 colleagues and those in the round table, and also those who

26 made presentations. I think it has been extremely useful  
27 to us and I thank everyone for their constructive  
28 participation.
